

Application Notes for Configuring Avaya Aura® Communication Manager R7.0, Avaya Aura® Session Manager R7.0 and Avaya Session Border Controller for Enterprise R7.1 to support IntelPeer CoreCloud SIP Trunk Service on Sonus Platform– Issue 1.0

Abstract

These Application Notes describe the procedures for configuring Session Initiation Protocol (SIP) Trunk Service on an enterprise solution consisting of Avaya Aura® Communication Manager Rel. 7.0, Avaya Aura® Session Manager Rel. 7.0 and Avaya Session Border Controller for Enterprise Rel. 7.1, to interoperate with the IntelPeer CoreCloud SIP Trunk service on Sonus Platform.

The IntelPeer CoreCloud SIP Trunk service provide customers with PSTN access via a SIP trunk between the enterprise and the service provider's network, as an alternative to legacy analog or digital trunks. This approach generally results in lower cost for the enterprise.

Readers should pay attention to **Section 2**, in particular the scope of testing as outlined in **Section 2.1** as well as the observations noted in **Section 2.2**, to ensure that their own use cases are adequately covered by this scope and results.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe the procedures for configuring Session Initiation Protocol (SIP) Trunk Service between the IntelPeer CoreCloud network and an Avaya SIP-enabled enterprise solution. The Avaya solution consists of Avaya Aura® Communication Manager Rel. 7.0 (Communication Manager), Avaya Aura® Session Manager Rel. 7.0 (Session Manager), Avaya Session Border Controller for Enterprise (Avaya SBCE) Rel. 7.1 and various Avaya endpoints, listed in **Section 4**.

The IntelPeer CoreCloud SIP Trunking service referenced within these Application Notes is designed for business customers. Customers using this service with this Avaya enterprise solution are able to place and receive PSTN calls via a broadband WAN connection and the SIP protocol. This converged network solution is an alternative to traditional PSTN trunks such as analog and/or ISDN-PRI.

The terms “Service Provider” and “IntelPeer” will be used interchangeably throughout these Application Notes.

2. General Test Approach and Test Results

A simulated CPE site containing all the equipment for the Avaya SIP-enabled enterprise solution was installed at the Avaya Solution and Interoperability Lab. The enterprise site was configured to connect to the IntelPeer CoreCloud network via a broadband connection to the public Internet.

DevConnect Compliance Testing is conducted jointly by Avaya and DevConnect members. The jointly-defined test plan focuses on exercising APIs and/or standards-based interfaces pertinent to the interoperability of the tested products and their functionalities. DevConnect Compliance Testing is not intended to substitute full product performance or feature testing performed by DevConnect members, nor is it to be construed as an endorsement by Avaya of the suitability or completeness of a DevConnect member’s solution.

2.1. Interoperability Compliance Testing

To verify SIP Trunk interoperability, the following features and functionality were covered during the interoperability compliance test:

- Public DNS “A” record queries to establish the SIP trunk.
- Incoming PSTN calls to various phone types. Phone types included H.323, SIP, digital, and analog telephones at the enterprise. All inbound calls from the PSTN were routed to the enterprise across the SIP trunk from the service provider.
- Outgoing PSTN calls from various phone types. Phone types included H.323, SIP, digital, and analog telephones at the enterprise. All outbound calls to the PSTN were routed from the enterprise across the SIP trunk via the service provider network.
- Inbound and outbound PSTN calls to/from Avaya one-X® Communicator softphones using “This Computer” and “Other Phone” modes. (H.323, SIP).
- Inbound and outbound PSTN calls to/from Avaya Equinox softphones (SIP).
- Inbound and outbound PSTN calls to/from SIP remote workers using Avaya 96x1 Deskphones (Note that only the 96x1 SIP Deskphones was used to test remote worker functionality).
- Codec G.711MU and G.729.
- Inbound and outbound PSTN calls using VoIP media resources in Avaya Media Gateways and the Avaya Aura® Media Server at the enterprise network.
- DTMF tones passed as out-of-band RTP events as per RFC 2833.
- Caller ID presentation and Caller ID restriction.
- Voicemail redirection and navigation.
- User features such as hold and resume, transfer and conference.
- Off-net call transferring, call forwarding and mobility (extension to cellular).
- Support of SIP REFER method.
- T.38 Fax.
- Routing inbound PSTN calls to call center agent queues.
- Proper response/error treatment to different failure conditions.

Note – Remote Worker was tested as part of this solution. The configuration necessary to support remote workers is beyond the scope of these Application Notes and is not included in these Application Notes.

The following items were not tested:

- “911” emergency calls are supported but were not tested.
- Outbound international calls are supported but were not tested.
- “0” operator and “0+10” digits operator assisted calls are supported but were not tested.
- “411” local directory assistance calls are supported but were not tested.
- “302 Moved Temporarily/302 Re-Direction” is supported but was not tested.

2.2. Test Results

Interoperability testing of the IntelPeer CoreCloud SIP Trunk Service with the Avaya SIP-enabled enterprise solution was completed with successful results for all test cases with the observations/limitations noted below:

- **No matching codec on outbound calls:** If an unsupported audio codec is received by IntelPeer on the SIP Trunk (e.g., 722), IntelPeer will respond with “404 Not Found” instead of “488 Not Acceptable Here”, the user will hear re-order. This issue does not have any user impact, and should not be seen since the codecs will be matched during the initial installation, it is listed here simply as an observation.
- **Outbound Calling Party Number (CPN) Block:** When an enterprise user activated “Calling Party Number Block (CPN)” to enable user privacy on an outbound call, Communication Manager would send “anonymous” in the “From” header and the “Privacy: id” header, while the caller information was sent in the “P-Asserted-Identity” header. It was noticed that the calling party number was not always blocked. This issue was reported to IntelPeer.
- **SIP header optimization:** There are multiple SIP headers and parameters used by Communication Manager and Session Manager, some of them Avaya proprietary, that had no significance in the service provider’s network. These headers were removed with the purposes of blocking enterprise information from being propagated outside of the enterprise boundaries, to reduce the size of the packets entering the service provider’s network and to improve the solution interoperability in general. The following headers were removed from outbound messages using an Adaptation in Session Manager: AV-Global-Session-ID, AV-Correlation-ID, Alert-Info, Endpoint-View, P-AV-Message-Id, P-Charging-Vector and P-Location (**Section 6.4**).

2.3. Support

For support on IntelPeer CoreCloud SIP Trunk Service visit the corporate Web page at: <http://www.intelepeer.com/voice-services/sip-trunking.html> or call 877-336-9171.

3. Reference Configuration

Figure 1 illustrates the sample Avaya SIP-enabled enterprise solution, connected to the IntelPeer CoreCloud SIP Trunk Service through a public Internet WAN connection.

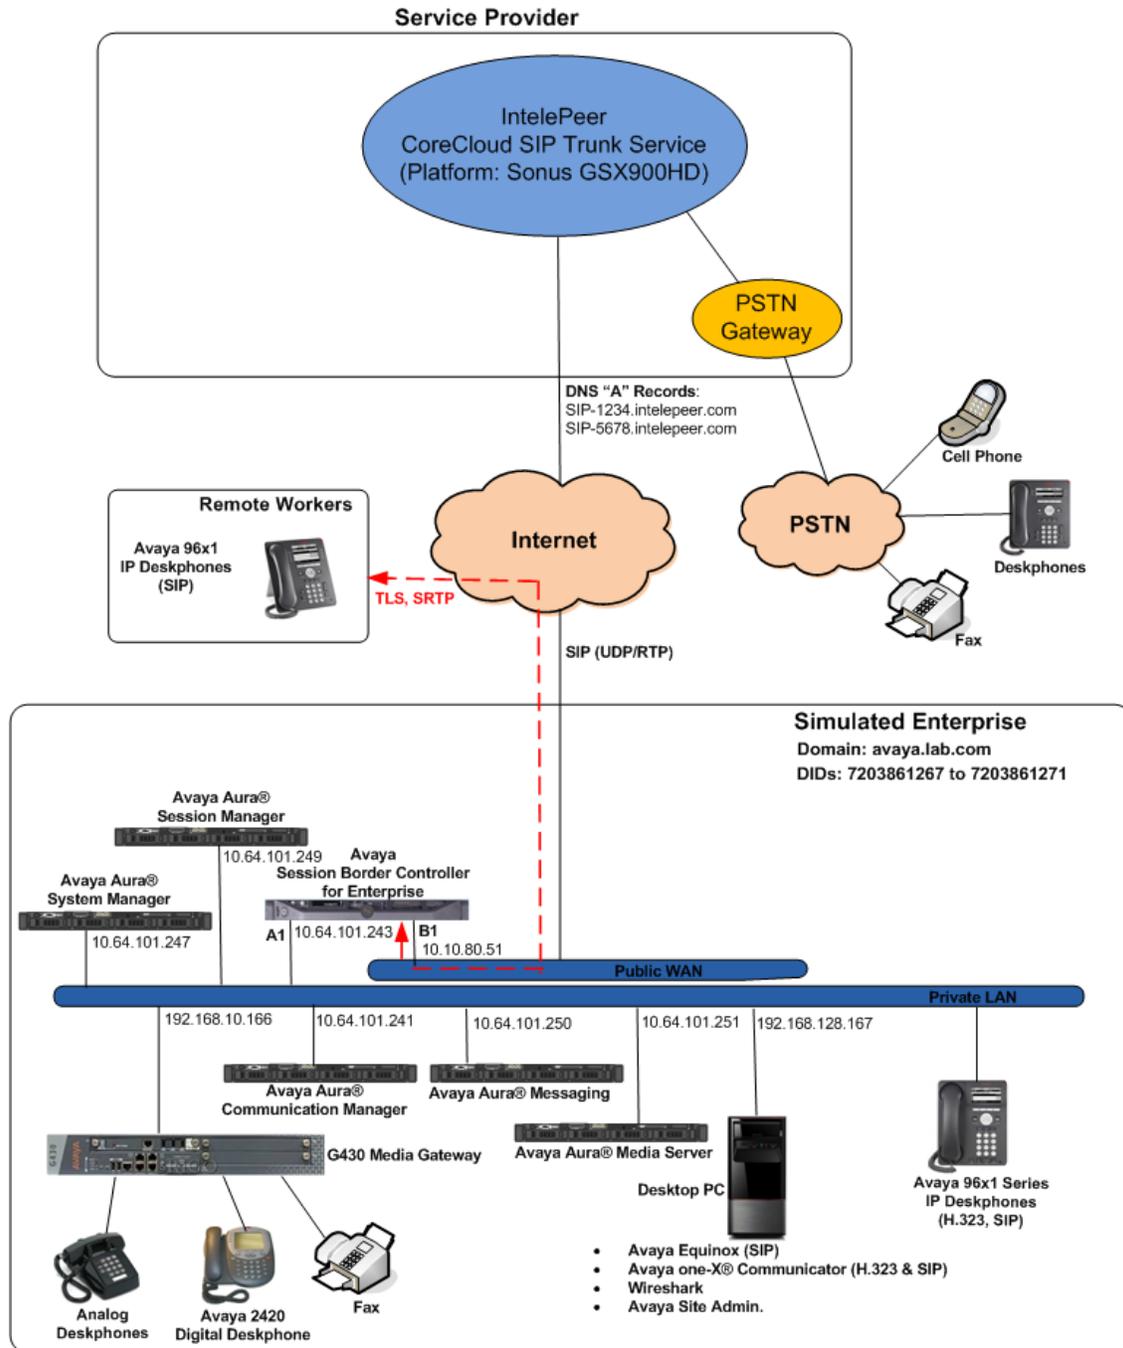

Figure 1: Avaya SIP Enterprise Solution connected to IntelPeer CoreCloud SIP Trunk Service

The Avaya components used to create the simulated enterprise customer site included:

- Avaya Aura® Communication Manager.
- Avaya Aura® Session Manager.
- Avaya Aura® System Manager.
- Avaya Session Border Controller for Enterprise.
- Avaya Aura® Messaging.
- Avaya Aura® Media Server.
- Avaya G430 Media Gateway.
- Avaya 96x1 Series IP Deskphones (H.323 and SIP).
- Avaya one-X® Communicator softphones (H.323 and SIP).
- Avaya Equinox softphone (SIP).
- Avaya digital and analog telephones.

Additionally, the reference configuration included remote worker functionality. A remote worker is a SIP endpoint that resides in the untrusted network, registered to the Session Manager at the enterprise via the Avaya SBCE. Remote workers offer the same functionality as any other endpoint at the enterprise. This functionality was successfully tested during the compliance test using only the Avaya 96x1 SIP Deskphones. For signaling, Transport Layer Security (TLS) and for media, Secure Real-time Transport Protocol (SRTP) was used on Avaya 96x1 SIP Deskphones used to test remote worker functionality. Other Avaya SIP endpoints that are supported in a Remote Worker configuration deployment were not tested.

The configuration tasks required to support remote workers are beyond the scope of these Application Notes; hence they are not discussed in this document. Consult [9] in the **References** section for additional information on this topic.

The Avaya SBCE was located at the edge of the enterprise. Its public side was connected to the public Internet, while its private side was connected to the enterprise infrastructure. All signaling and media traffic entering or leaving the enterprise flowed through the Avaya SBCE, protecting in this way the enterprise against any SIP-based attacks. The Avaya SBCE also performed network address translation at both the IP and SIP layers.

For security reasons, Avaya recommends the use of TLS for signaling and SRTP for media inside of the enterprise (private network side) and outside of the enterprise (public network side) if supported by the Service Provider. For the compliance, UDP transport for signaling and RTP for media was used outside of the enterprise (public network side, in between the Avaya SBCE and the IntelePeer network). TLS transport for signaling and SRTP for media was used inside of the enterprise (private network side, in between all of the Avaya components inside of the enterprise).

The configuration tasks required to support TLS transport for signaling and SRTP for media inside of the enterprise (private network side) are beyond the scope of these Application Notes; hence they are not discussed in this document.

For inbound calls, the calls flowed from the service provider to the Avaya SBCE then to Session Manager. Session Manager used the configured dial patterns (or regular expressions) and routing policies to determine the recipient (in this case Communication Manager) and on which link to send the call. Once the call arrived at Communication Manager, further incoming call treatment, such as incoming digit translation was performed.

Outbound calls to the PSTN were first processed by Communication Manager for outbound feature treatment such as automatic route selection and class of service restrictions. Once Communication Manager selected the proper SIP trunk, the call was routed to Session Manager. Session Manager once again used the configured dial patterns (or regular expressions) and routing policies to determine the route to the Avaya SBCE for egress to the IntelPeer network.

A separate SIP trunk was created between Communication Manager and Session Manager to carry the service provider traffic. This was done so that any trunk or codec settings required by the service provider could be applied only to this trunk without affecting other enterprise SIP traffic. This trunk carried both inbound and outbound traffic.

As part of the Avaya Aura® version 7.0 release, Communication Manager incorporates the ability to use the Avaya Aura® Media Server (AAMS) as a media resource. The AAMS is a software-based, high density media server that provides DSP resources for IP-based sessions. Media resources from both the AAMS and a G430 Media Gateway were utilized during the compliance test. The configuration of the AAMS is not discussed in this document. For more information on the installation and administration of the AAMS in Communication Manager refer to the AAMS documentation listed in the **References** section.

Avaya Aura® Messaging was used during the compliance test to verify voice mail redirection and navigation, as well as the delivery of Message Waiting Indicator (MWI) messages to the enterprise telephones. Since the configuration tasks for Messaging are not directly related to the interoperability tests with the IntelPeer CoreCloud network SIP Trunk service, they are not included in these Application Notes.

4. Equipment and Software Validated

The following equipment and software were used for the sample configuration provided:

Equipment/Software	Release/Version
Avaya	
Avaya Aura® Communication Manager	7.0.1.2 (Service Pack 2) (00.0.441.0-23523)
Avaya Aura® Session Manager	7.0.1.2 (Service Pack 2) (7.0.1.2.701230)
Avaya Aura® System Manager	7.0.1.2 (Service Pack 2) Build No. 7.0.0.0.16266 Software Update Rev. No. 7.0.1.2.086007
Avaya Session Border Controller for Enterprise	ASBCE 7.1 – SP2 7.1.0.2-01-13249
Avaya Aura® Messaging	7.0 Service Pack 0 (MSG-00.0.441.0-017_0004)
Avaya Aura® Media Server	7.7 FP1 SP2 7.7.0.375
Avaya G430 Media Gateway	G430_sw_37_41_0
Avaya 96x1 Series IP Deskphones (SIP)	Version 7.0.1.4.6
Avaya 96x1 Series IP Deskphones (H.323)	Version 6.6401
Avaya one-X® Communicator (H.323, SIP)	6.2.12.04-SP12
Avaya Equinox (SIP)	3.0.0.147
Avaya 2420 Series Digital Deskphones	N/A
Avaya 6210 Analog Deskphones	N/A
IntelePeer	
Sonus Network Inc. GSX9000HD	V09.00.13 R000

The specific configuration above was used for the compliance testing. Note that this solution will be compatible with other Avaya Servers and Media Gateway platforms running similar versions of Communication Manager and Session Manager.

Note – The Avaya Aura® servers and the Avaya SBCE used in the reference configuration and shown on the previous table were deployed on a virtualized environment. These Avaya components ran as virtual machines over VMware® (ESXi 6.0.0) platforms. Consult the installation documentation on the **References** section for more information.

5. Configure Avaya Aura® Communication Manager

This section describes the procedure for configuring Communication Manager to work with the IntelPeer CoreCloud network SIP Trunk service. A SIP trunk is established between Communication Manager and Session Manager for use by signaling traffic to and from the service provider. It is assumed that the general installation of Communication Manager, the Avaya G430 Media Gateway and the Avaya Aura® Media Server has been previously completed and is not discussed here.

The Communication Manager configuration was performed using the System Access Terminal (SAT). Some screens in this section have been abridged and highlighted for brevity and clarity in presentation. Some screens captures will show the use of the **change** command instead of the **add** command, since the configuration used for the testing was previously added.

5.1. Licensing and Capacity

Use the **display system-parameters customer-options** command to verify that the **Maximum Administered SIP Trunks** value on **Page 2** is sufficient to support the desired number of simultaneous SIP calls across all SIP trunks at the enterprise including any trunks to and from the service provider. The example shows that **24000** licenses are available and **112** are in use. The license file installed on the system controls the maximum values for these attributes. If a required feature is not enabled or there is insufficient capacity, contact an authorized Avaya sales representative.

```
display system-parameters customer-options Page 2 of 12
OPTIONAL FEATURES

IP PORT CAPACITIES                               USED
Maximum Administered H.323 Trunks: 12000 0
Maximum Concurrently Registered IP Stations: 18000 1
Maximum Administered Remote Office Trunks: 12000 0
Maximum Concurrently Registered Remote Office Stations: 18000 0
Maximum Concurrently Registered IP eCons: 414 0
Max Concur Registered Unauthenticated H.323 Stations: 100 0
Maximum Video Capable Stations: 41000 0
Maximum Video Capable IP Softphones: 18000 7
Maximum Administered SIP Trunks: 24000 112
Maximum Administered Ad-hoc Video Conferencing Ports: 24000 0
Maximum Number of DS1 Boards with Echo Cancellation: 522 0

(NOTE: You must logoff & login to effect the permission changes.)
```

5.2. System Features

Use the **change system-parameters features** command to set the **Trunk-to-Trunk Transfer** field to **all** to allow incoming calls from the PSTN to be transferred to another PSTN endpoint. If for security reasons incoming calls should not be allowed to transfer back to the PSTN, then leave the field set to **none**.

```
display system-parameters features Page 1 of 19
FEATURE-RELATED SYSTEM PARAMETERS

```

5.4. Codecs

Use the **change ip-codec-set** command to define a list of codecs to use for calls between the enterprise and the service provider. For the compliance test, ip-codec-set 2 was used for this purpose. Enter the corresponding codec in the **Audio Codec** column of the table. IntelPeer supports audio codecs *G.711MU* and *G.729*.

```
change ip-codec-set 2 Page 1 of 2
```

IP CODEC SET

Codec Set: 2

	Audio Codec	Silence Suppression	Frames Per Pkt	Packet Size(ms)

H.323 Clear-channel	<u>n</u>	<u>0</u>		
SIP 64K Data	<u>n</u>	<u>0</u>		<u>20</u>

5.5. IP Network Regions

Create a separate IP network region for the service provider trunk group. This allows for separate codec or quality of service settings to be used (if necessary) for calls between the enterprise and the service provider versus calls within the enterprise or elsewhere. For the compliance test, IP Network Region 2 was chosen for the service provider trunk. Use the **change ip-network-region 2** command to configure region 2 with the following parameters:

- Set the **Authoritative Domain** field to match the SIP domain of the enterprise. In this configuration, the domain name is *avaya.lab.com* as assigned to the shared test environment in the Avaya test lab. This domain name appears in the “From” header of SIP messages originating from this IP region.
- Enter a descriptive name in the **Name** field.
- Leave both **Intra-region** and **Inter-region IP-IP Direct Audio** set to *yes*, the default setting. This will enable **IP-IP Direct Audio** (shuffling), to allow audio traffic to be sent directly between IP endpoints without using media resources in the Avaya Media Gateway and Media Server. Shuffling can be further restricted at the trunk level on the Signaling Group form if needed.
- Set the **Codec Set** field to the IP codec set defined in **Section 5.4**.
- Default values may be used for all other fields.

```
change ip-network-region 2                                     Page 1 of 20
                                                              IP NETWORK REGION
Region: 2
Location: 1          Authoritative Domain: avaya.lab.com

Keep-Alive Interval (sec): 5
Keep-Alive Count: 5
```

On **Page 4**, define the IP codec set to be used for traffic between region 2 and region 1 (the rest of the enterprise). Enter the desired IP codec set in the **codec set** column of the row with destination region (**dst rgn**) 1. Default values may be used for all other fields. The following example shows the settings used for the compliance test. It indicates that codec set **2** will be used for calls between region 2 (the service provider region) and region 1 (the rest of the enterprise).

change ip-network-region 2										Page 4 of 20

5.6. Signaling Group

Use the **add signaling-group** command to create a signaling group between Communication Manager and Session Manager for use by the service provider trunk. This signaling group is used for inbound and outbound calls between the service provider and the enterprise. For the compliance test, signaling group 2 was used and was configured using the parameters highlighted below, shown on the screen on the next page:

- Set the **Group Type** field to *sip*.
- Set the **IMS Enabled** field to *n*. This specifies the Communication Manager will serve as an Evolution Server for the Session Manager.
- Set the **Transport Method** to the transport protocol to be used between Communication Manager and Session Manager. For the compliance test, *tls* was used.
- Set the **Peer Detection Enabled** field to *y*. The **Peer-Server** field will initially be set to *Others* and cannot be changed via administration. Later, the **Peer-Server** field will automatically change to *SM* once Communication Manager detects its peer is a Session Manager.

Note: Once the **Peer-Server** field is updated to *SM*, the system changes the default values of the following fields, setting them to display-only:

- **Prepend '+' to Outgoing Calling/Alerting/Diverting/Connected Public Numbers?** is changed to *y*.

- Remove '+' from Incoming Called/Calling/Alerting/Diverting/Connected Numbers? is changed to *n*.
- Set the **Near-end Node Name** to *procr*. This node name maps to the IP address of the Communication Manager as defined in **Section 5.3**.
- Set the **Far-end Node Name** to *SM*. This node name maps to the IP address of Session Manager, as defined in **Section 5.3**
- Set the **Near-end Listen Port** and **Far-end Listen Port** to a valid unused port instead of the default well-known port value. (For TLS, the well-known port value is 5061). This is necessary so Session Manager can distinguish this trunk from the trunk used for other enterprise SIP traffic. The compliance test was conducted with the **Near-end Listen Port** and **Far-end Listen Port** set to *5071*.
- Set the **Far-end Network Region** to the IP network region defined for the Service Provider in **Section 5.5**.
- Set the **Far-end Domain** to the domain of the enterprise.
- Set the **DTMF over IP** field to *rtp-payload*. This value enables Communication Manager to send DTMF transmissions using RFC 2833.
- Set **Direct IP-IP Audio Connections** to *y*. This field will enable media shuffling on the SIP trunk allowing Communication Manager to redirect media traffic directly between the Avaya SBCE and the enterprise endpoint. If this value is set to *n*, then the Avaya Media Gateway or Media Server will remain in the media path of all calls between the SIP trunk and the endpoint. Depending on the number of media resources available in the Avaya Media Gateway and Media Server, these resources may be depleted during high call volume preventing additional calls from completing.
- Default values may be used for all other fields

```

5.7. Trunk Group

Use the **add trunk-group** command to create a trunk group for the signaling group created in **Section 5.6**. For the compliance test, trunk group 2 was configured using the parameters highlighted below.

- Set the **Group Type** field to *sip*.
- Enter a descriptive name for the **Group Name**.
- Enter an available trunk access code (TAC) that is consistent with the existing dial plan in the **TAC** field.
- Set the **Service Type** field to *public-ntwrk*.
- Set the **Signaling Group** to the signaling group shown in **Section 5.6**.
- Set the **Number of Members** field to the number of trunk members in the SIP trunk group. This value determines how many simultaneous SIP calls can be supported by this trunk.
- Default values were used for all other fields.

```
change trunk-group 2                                     Page 1 of 21
                                     TRUNK GROUP
Group Number: 2          Group Type: sip          CDR Reports: y
Group Name: Service Provider          COR: 1          TN: 1          TAC: 602
Direction: two-way          Outgoing Display? n
Dial Access? n          Night Service: _____
Queue Length: 0
Service Type: public-ntwrk          Auth Code? n
                                     Member Assignment Method: auto
                                     Signaling Group: 2
                                     Number of Members: 10
```

On **Page 2**, verify that the **Preferred Minimum Session Refresh Interval** is set to a value acceptable to the service provider. This value defines the interval that re-INVITEs must be sent to keep the active session alive. The default value of **600** seconds was used.

```
change trunk-group 2                                     Page 2 of 21
  Group Type: sip

Caller ID for Service Link Call to H.323 1xC: station-extension
```

On Page 3:

- Set the **Numbering Format** field to *public*. This field specifies the format of the calling party number (CPN) sent to the far-end. When *public* format is used, Communication Manager automatically inserts a “+” sign, preceding the numbers in the “From”, “Contact” and “P-Asserted Identity” (PAI) headers. To keep uniformity with the format used by IntelPeer, the **Numbering Format** was set to *public* and the **Numbering Format** in the route pattern was set to *pub-unk* (see **Section 5.10**).
- Set the **Replace Restricted Numbers** and **Replace Unavailable Numbers** fields to *y*. This will allow the CPN displayed on local endpoints to be replaced with the value set in **Section 5.2**, if the inbound call has enabled CPN block.

```
change trunk-group 2                                     Page 3 of 21

5.8. Calling Party Information

The calling party number is sent in the SIP “From”, “Contact” and “PAI” headers. Since public numbering was selected to define the format of this number (**Section 5.7**), use the **change public-unknown-numbering** command to create an entry for each extension which has a DID assigned. DID numbers are provided by the SIP service provider. Each DID number is assigned in this table to one enterprise internal extension or Vector Directory Numbers (VDNs). In the example below, five DID numbers were assigned by the service provider for testing. These DID numbers were used as the outbound calling party information on the service provider trunk when calls were originated from the mapped extensions.

change public-unknown-numbering 1					Page 1 of 2
NUMBERING - PUBLIC/UNKNOWN FORMAT					
Ext Len	Ext Code	Trk Grp(s)	CPN Prefix	Total CPN Len	
4	3			4	Total Administered: 7 Maximum Entries: 9999
4	5			4	
4	3040	2	17203861267	11	Note: If an entry applies to a SIP connection to Avaya Aura(R) Session Manager, the resulting number must be a complete E.164 number. Communication Manager automatically inserts a '+' digit in this case.
4	3044	2	17203861269	11	
4	3047	2	17203861271	11	
4	3050	2	17203861268	11	
4	5015	2	17203861270	11	
—	—	—	—	—	
—	—	—	—	—

—	—	—	—	—	
—	—	—	—	—	
—	—	—	—	—	
—	—	—	—	—	

5.9. Inbound Routing

In general, the “incoming call handling treatment” form for a trunk group can be used to manipulate the digits received for an incoming call if necessary. Since Session Manager is present, Session Manager can be used to perform digit conversion using an Adaptation, and digit manipulation via the Communication Manager incoming call handling table may not be necessary. If the DID number sent by IntelPeer is left unchanged by Session Manager, then the DID number can be mapped to an extension using the incoming call handling treatment of the receiving trunk group. Use the **change inc-call-handling-trmt** command to create an entry for each DID.

```
change inc-call-handling-trmt trunk-group 2 Page 1 of 30
```

INCOMING CALL HANDLING TREATMENT				
Service/ Feature	Number Len	Number Digits	Del	Insert
public-ntwrk	12	+17203861267	12	3040
public-ntwrk	12	+17203861268	12	3050
public-ntwrk	12	+17203861269	12	3044
public-ntwrk	12	+17203861270	12	3224

public-ntwrk	---	---	---	---

5.10. Outbound Routing

In these Application Notes, the Automatic Route Selection (ARS) feature is used to route outbound calls via the SIP trunk to the service provider. In the sample configuration, the single digit 9 is used as the ARS access code. Enterprise callers will dial 9 to reach an “outside line”. This common configuration is illustrated below with little elaboration. Use the **change dialplan analysis** command to define a dialed string beginning with 9 of length 1, as a feature access code (*fac*).

change dialplan analysis			DIAL PLAN ANALYSIS TABLE			Page 1 of 12		
			Location: all			Percent Full: 2		
Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type
0	13	udp						
1	4	dac						
2	4	ext						
3	4	ext						
4	4	udp						
5	4	ext						
6	3	dac						
7	4	ext						
8	1	fac						
9	1	fac						
*	3	dac						
#	2	dac						

Use the **change feature-access-codes** command to configure **9** as the **Auto Route Selection (ARS) – Access Code 1**.

```
change feature-access-codes Page 1 of 10
FEATURE ACCESS CODE (FAC)
Abbreviated Dialing List1 Access Code: ____
Abbreviated Dialing List2 Access Code: ____
Abbreviated Dialing List3 Access Code: ____
Abbreviated Dial - Prgm Group List Access Code: ____
Announcement Access Code: #7 ____
Answer Back Access Code: ____
Attendant Access Code: ____
Auto Alternate Routing (AAR) Access Code: 8 ____
Auto Route Selection (ARS) - Access Code 1: 9 ____ Access Code 2: ____
Automatic Callback Activation: ____ Deactivation: ____
Call Forwarding Activation Busy/DA: ____ All: ____ Deactivation: ____
Call Forwarding Enhanced Status: ____ Act: ____ Deactivation: ____
Call Park Access Code: ____
Call Pickup Access Code: ____
CAS Remote Hold/Answer Hold-Unhold Access Code: ____
CDR Account Code Access Code: ____
Change COR Access Code: ____
Change Coverage Access Code: ____
Conditional Call Extend Activation: ____ Deactivation: ____
Contact Closure Open Code: ____ Close Code: ____
```

Use the **change ars analysis** command to configure the routing of dialed digits following the first digit 9. The example below shows a subset of the dialed strings tested as part of the compliance test. See **Section 2.1** for the complete list of call types tested. All dialed strings are mapped to route pattern 2, which contains the SIP trunk group to the service provider.

```
change ars analysis 17
```

Page 1 of 2

ARS DIGIT ANALYSIS TABLE
Location: all Percent Full: 0

Dialed String	Total Min	Total Max	Route Pattern	Call Type	Node Num	ANI Reqd
170	11	11	deny	fnpa	---	n
1700	11	11	deny	fnpa	---	n
171	11	11	deny	fnpa	---	n
172	11	11	2	fnpa	---	n
173	11	11	deny	fnpa	---	n
174	11	11	deny	fnpa	---	n
175	11	11	deny	fnpa	---	n
176	11	11	deny	fnpa	---	n
177	11	11	deny	fnpa	---	n
178	11	11	deny	fnpa	---	n
1786	11	11	2	fnpa	---	n
179	11	11	deny	fnpa	---	n
180	11	11	deny	fnpa	---	n
1800	11	11	2	fnpa	---	n
1800555	11	11	deny	fnpa	---	n

The route pattern defines which trunk group will be used for the call and performs any necessary digit manipulation. Use the **change route-pattern** command to configure the parameters for the service provider trunk route pattern in the following manner. The example below shows the values used for route pattern 2 in the compliance test.

- **Pattern Name:** Enter a descriptive name.
- **Grp No:** Enter the outbound trunk group for the SIP service provider.
- **FRL:** Set the Facility Restriction Level (FRL) field to a level that allows access to this trunk for all users that require it. The value of **0** is the least restrictive level.
- **Pfx Mrk:** Set to **1** to ensure 1 + 10 digits are sent to the service provider for long distance numbers in the North American Numbering Plan (NANP).
- **Numbering Format:** Set to *pub-unk*. All calls using this route pattern will use the public numbering table. See setting of the **Numbering Format** in the trunk group form for full details in **Section 5.7**.

Note - Enter the **save translation** command (not shown) to save all the changes made to the Communication Manager configuration in the previous sections.

6. Configure Avaya Aura® Session Manager

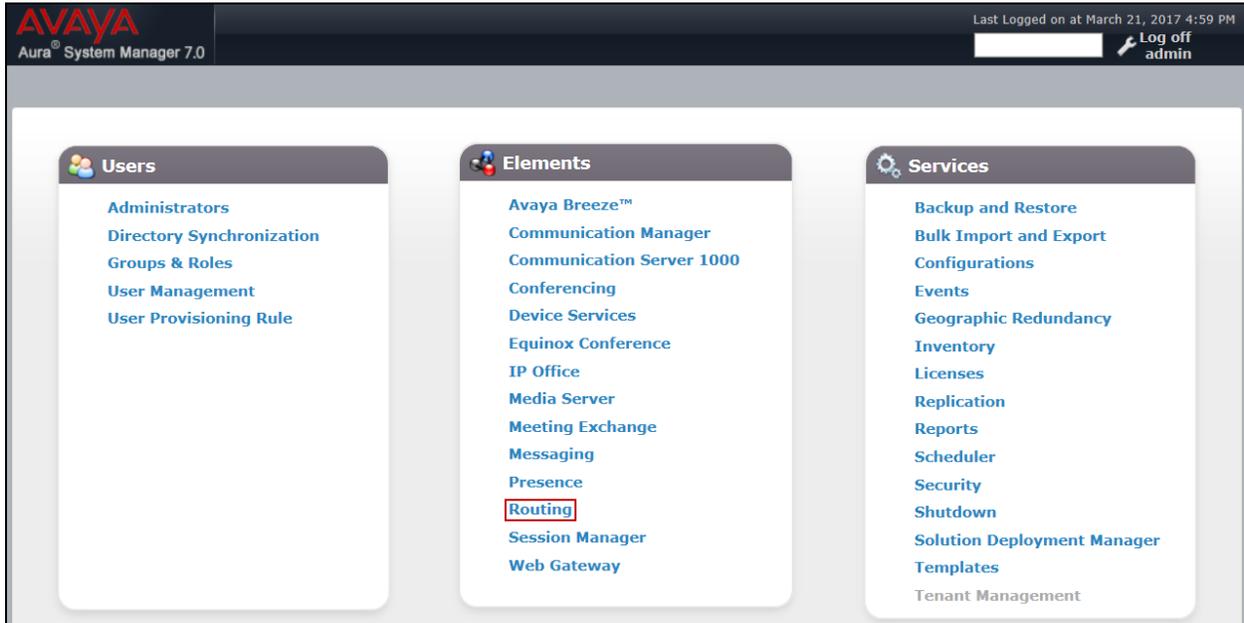

This section provides the procedures for configuring Session Manager. The procedures include adding the following items:

- SIP domain.
- Logical/physical Locations that can be occupied by SIP Entities.
- Adaptation module to perform header manipulations.
- SIP Entities corresponding to Communication Manager, Session Manager and the Avaya SBCE.
- Entity Links, which define the SIP trunk parameters used by Session Manager when routing calls to/from SIP Entities.
- Routing Policies, which control call routing between the SIP Entities.
- Dial Patterns, which govern to which SIP Entity a call is routed.

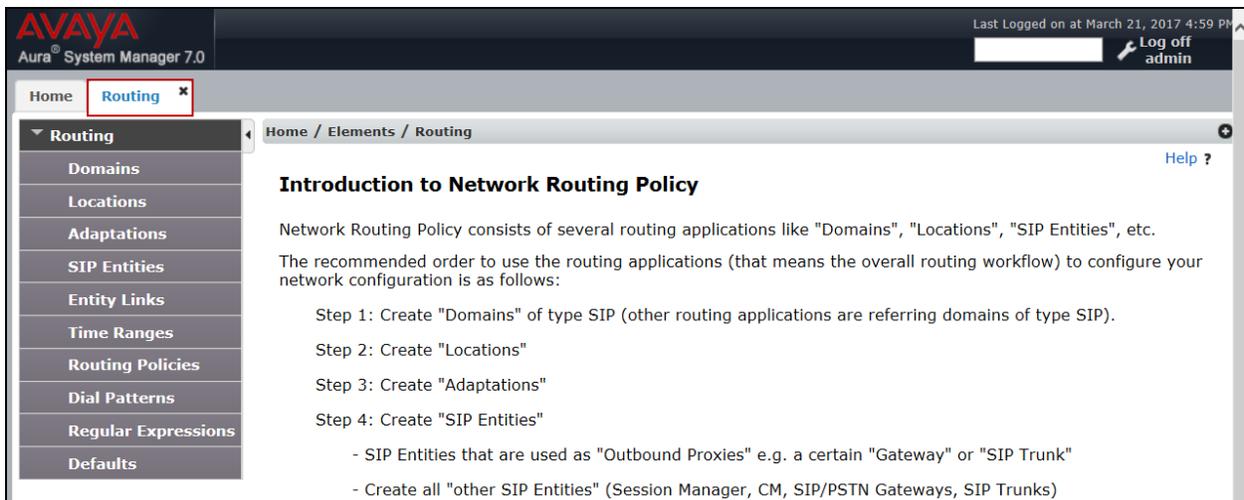

The following sections assume that the initial configuration of Session Manager and System Manager has already been completed, and that network connectivity exists between System Manager and Session Manager.

6.1. System Manager Login and Navigation

Session Manager configuration is accomplished by accessing the browser-based GUI of System Manager, using the URL “https://<ip-address>/SMGR”, where “<ip-address>” is the IP address of System Manager. Log in with the appropriate credentials and click on **Log On** (not shown). The screen shown below is then displayed; click on **Routing**.

The navigation tree displayed in the left pane below will be referenced in subsequent sections to navigate to items requiring configuration. Most items discussed in this section will be located under the **Routing** link shown below.

6.2. SIP Domain

Create an entry for each SIP domain for which Session Manager will need to be aware in order to route calls. For the compliance test, this was the enterprise domain, *avaya.lab.com*. Navigate to **Routing** → **Domains** in the left-hand navigation pane and click the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

- **Name:** Enter the domain name.
- **Type:** Select **sip** from the pull-down menu.
- **Notes:** Add a brief description (optional).
- Click **Commit** to save.

The screen below shows the entry for the enterprise domain.

The screenshot displays the Avaya Aura System Manager 7.0 interface. The top navigation bar includes the Avaya logo, 'Aura System Manager 7.0', and a 'Log off admin' button. The left-hand navigation pane shows a tree view with 'Routing' and 'Domains' selected. The main content area is titled 'Domain Management' and features a table with one entry. The table has columns for 'Name', 'Type', and 'Notes'. The entry is 'avaya.lab.com', 'sip', and 'HG V-Domain' respectively. A 'Filter: Enable' option is visible on the right side of the table.

Name	Type	Notes
avaya.lab.com	sip	HG V-Domain

6.3. Locations

Locations can be used to identify logical and/or physical locations where SIP Entities reside for purposes of bandwidth management, call admission control and location-based routing. To add a location, navigate to **Routing** → **Locations** in the left-hand navigation pane and click the **New** button in the right pane (not shown). In the **General** section, enter the following values:

- **Name:** Enter a descriptive name for the location.
- **Notes:** Add a brief description (optional).
- Click **Commit** to save.

The following screen shows the location details for the location named *Session Manager*. Later, this location will be assigned to the SIP Entity corresponding to Session Manager. Other location parameters (not shown) retained the default values.

The screenshot displays the Avaya Aura System Manager 7.0 interface. The top navigation bar includes the Avaya logo, the text 'Aura System Manager 7.0', and a user session summary: 'Last Logged on at March 21, 2017 4:59 PM' with a 'Log off admin' button. The breadcrumb trail is 'Home / Elements / Routing / Locations'. The left sidebar menu is expanded to 'Routing', with 'Locations' highlighted. The main content area is titled 'Location Details' and contains the following fields:

- General**
 - * Name: Session Manager
 - Notes: VMware Session Manager
- Dial Plan Transparency in Survivable Mode**
 - Enabled:
 - Listed Directory Number:
 - Associated CM SIP Entity:

Buttons for 'Commit' and 'Cancel' are located in the top right corner of the form area.

The following screen shows the location details for the location named *Communication Manager*. Later, this location will be assigned to the SIP Entity corresponding to Communication Manager. Other location parameters (not shown) retained the default values.

The screenshot displays the Avaya Aura System Manager 7.0 interface, similar to the previous one. The top navigation bar and breadcrumb trail are identical. The left sidebar menu is expanded to 'Routing', with 'Locations' highlighted. The main content area is titled 'Location Details' and contains the following fields:

- General**
 - * Name: Communication Manager
 - Notes: VMware Communication Manager
- Dial Plan Transparency in Survivable Mode**
 - Enabled:
 - Listed Directory Number:
 - Associated CM SIP Entity:

Buttons for 'Commit' and 'Cancel' are located in the top right corner of the form area.

The following screen shows the location details for the location named *Avaya SBCE*. Later, this location will be assigned to the SIP Entity corresponding to the Avaya SBCE. Other location parameters (not shown) retained the default values.

The screenshot displays the Avaya Aura System Manager 7.0 interface. The top navigation bar includes the Avaya logo, the text "Aura® System Manager 7.0", and a "Log off admin" button. The breadcrumb trail is "Home / Elements / Routing / Locations". The left sidebar menu is expanded to "Routing", with "Locations" selected. The main content area is titled "Location Details" and contains the following fields:

- General**
 - * Name: Avaya SBCE
 - Notes: VMware Avaya SBCE
- Dial Plan Transparency in Survivable Mode**
 - Enabled:
 - Listed Directory Number:
 - Associated CM SIP Entity:

Buttons for "Commit" and "Cancel" are located in the top right corner of the form area.

6.4. Adaptations

In order to improve interoperability with third party elements, Session Manager 7.0 incorporates the ability to use Adaptation modules to remove specific headers that are either Avaya proprietary or deemed excessive/unnecessary for non-Avaya elements.

For the compliance test, an Adaptation named *CM_Outbound_Header_Removal* was created to block the following headers from outbound messages, before they were forwarded to the Avaya SBCE: AV-Global-Session-ID, AV-Correlation-ID, Alert-Info, Endpoint-View, P-AV-Message-ID, P-Charging-Vector and P-Location. These headers contain private information from the enterprise, which should not be propagated outside of the enterprise boundaries. They also add unnecessary size to outbound messages, while they have no significance to the service provider.

Navigate to **Routing** → **Adaptations** in the left-hand navigation pane and click the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

- **Adaptation Name:** Enter an appropriate name.
- **Module Name:** Select the *DigitConversionAdapter* option.
- **Module Parameter Type:** Select *Name-Value Parameter*.

Click **Add** to add the name and value parameters, as follows:

- **Name:** Enter *eRHdrs*. This parameter will remove the specified headers from messages in the egress direction.
- **Value:** Enter “*Alert-Info, P-Charging-Vector, AV-Global-Session-ID, AV-Correlation-ID, P-AV-Message-Id, P-Location, Endpoint-View*”
- Click **Commit** to save.

The screen below shows the adaptation created for the compliance test. This adaptation will later be applied to the SIP Entity corresponding to the Avaya SBCE. All other fields were left at their default values.

The screenshot displays the Avaya Aura System Manager 7.0 interface. The top navigation bar includes the Avaya logo, 'Aura System Manager 7.0', and a user session summary: 'Last Logged on at March 21, 2017 4:59 PM' with a 'Log off admin' button. A breadcrumb trail shows 'Home / Elements / Routing / Adaptations'. The left sidebar contains a menu with 'Routing' selected, and sub-items: Domains, Locations, Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The main content area is titled 'Adaptation Details' and includes 'Commit' and 'Cancel' buttons. Under the 'General' section, the following fields are visible:

- * Adaptation Name: CM_Outbound_Header_Removal
- * Module Name: DigitConversionAdapter
- Module Parameter Type: Name-Value Parameter

 Below these fields is a table with 'Add' and 'Remove' buttons. The table has columns for 'Name' and 'Value'. One entry is highlighted:

Name	Value
leRHdrs	"Alert-Info, P-Charging-Vector, AV-Global-Session-ID, AV-Correlation-ID, P-AV-Message-Id, P-

 At the bottom of the table, it says 'Select : All, None'.

6.5. SIP Entities

A SIP Entity must be added for Session Manager and for each SIP telephony system connected to it, which includes Communication Manager and the Avaya SBCE. Navigate to **Routing** → **SIP Entities** in the left navigation pane and click on the **New** button in the right pane (not shown). In the **General** section, enter the following values. Use default values for all remaining fields:

- **Name:** Enter a descriptive name.
- **FQDN or IP Address:** Enter the FQDN or IP address of the SIP Entity that is used for SIP signaling (see **Figure 1**).
- **Type:** Select *Session Manager* for Session Manager, *CM* for Communication Manager and *SIP Trunk* (or *Other*) for the Avaya SBCE.
- **Adaptation:** This field is only present if **Type** is not set to **Session Manager**. If Adaptations were to be created, here is where they would be applied to the entity.
- **Location:** Select the location that applies to the SIP Entity being created, defined in **Section 6.3**.
- **Time Zone:** Select the time zone for the location above.
- Click **Commit** to save.

The following screen shows the addition of the *Session Manager* SIP Entity for Session Manager. The IP address of the Session Manager Security Module is entered in the **FQDN or IP Address** field.

The screenshot displays the Avaya Aura System Manager 7.0 interface. The top navigation bar shows 'Home' and 'Routing' (highlighted with a red box). The left sidebar contains a menu with 'Routing' (highlighted with a red box) and 'SIP Entities' (highlighted with a red box). The main content area is titled 'SIP Entity Details' and shows the 'General' section. The form fields are as follows:

- Name:** Session Manager
- FQDN or IP Address:** 10.64.101.249
- Type:** Session Manager
- Notes:** VMware Session Manager
- Location:** Session Manager
- Outbound Proxy:** (empty)
- Time Zone:** America/New_York
- Credential name:** (empty)

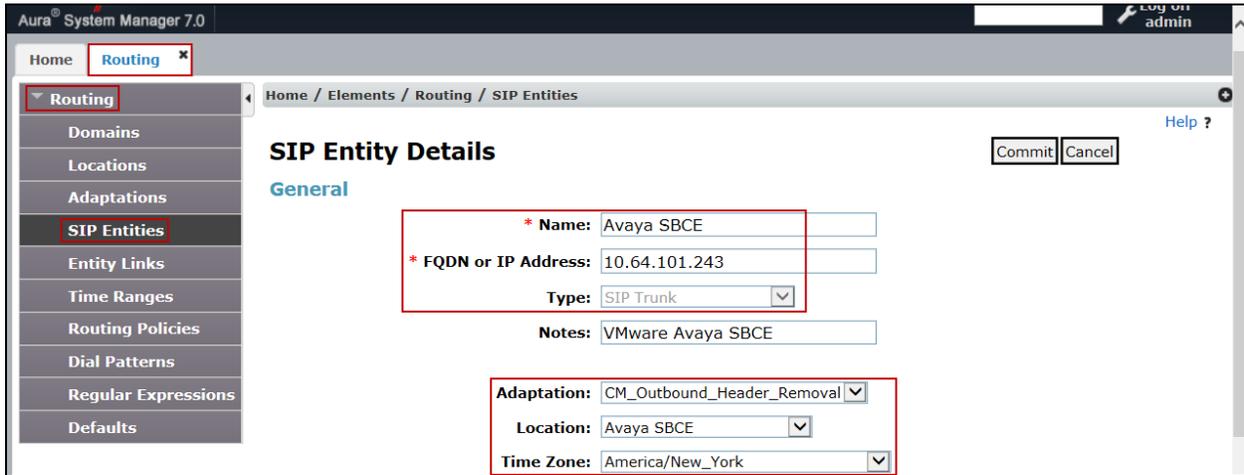

Buttons for 'Commit' and 'Cancel' are visible in the top right of the form area.

The following screen shows the addition of the *Communication Manager Trunk 2* SIP Entity for Communication Manager. In order for Session Manager to send SIP service provider traffic on a separate entity link to Communication Manager, the creation of a separate SIP entity for Communication Manager is required. This SIP Entity should be different than the one created during the Session Manager installation, used by all other enterprise SIP traffic. The **FQDN or IP Address** field is set to the IP address of the “**procr**” interface in Communication Manager, as seen in **Section 5.3**. Select the location that applies to the SIP Entity being created, defined in **Section 6.3**.

The screenshot displays the Avaya Aura System Manager 7.0 interface. The top navigation bar includes the Avaya logo, the text 'Aura System Manager 7.0', and a user session summary showing 'Last Logged on at March 21, 2017 4:59 PM' and a 'Log off admin' button. The breadcrumb trail is 'Home / Elements / Routing / SIP Entities'. The left sidebar contains a menu with 'Routing' selected, and sub-items: Domains, Locations, Adaptations, SIP Entities (highlighted), Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The main content area is titled 'SIP Entity Details' and includes a 'General' section. The form fields are: '* Name: Communication Manager Trunk 2', '* FQDN or IP Address: 10.64.101.241', 'Type: CM', 'Notes: Used for SP Testing', 'Adaptation: [empty]', 'Location: Communication Manager', and 'Time Zone: America/New_York'. 'Commit' and 'Cancel' buttons are located in the top right of the form area.

The following screen shows the addition of the *Avaya SBCE* SIP Entity for the Avaya SBCE:

- The **FQDN or IP Address** field is set to the IP address of the SBC private network interface (see **Figure 1**).
- On the **Adaptation** field, the adaptation module *CM_Outbound_Header_Removal* previously defined in **Section 6.4** was selected.
- Select the location that applies to the SIP Entity being created, defined in **Section 6.3**.

6.6. Entity Links

A SIP trunk between Session Manager and a telephony system is described by an Entity Link. Two Entity Links were created; one to the Communication Manager for use only by service provider traffic and one to the Avaya SBCE. To add an Entity Link, navigate to **Routing** → **Entity Links** in the left navigation pane and click on the **New** button in the right pane (not shown). Fill in the following fields in the new row that is displayed:

- **Name:** Enter a descriptive name.
- **SIP Entity 1:** Select the Session Manager from the drop-down menu (**Section 6.5**).
- **Protocol:** Select the transport protocol used for this link (**Section 5.6**).
- **Port:** Port number on which Session Manager will receive SIP requests from the far-end (**Section 5.6**).
- **SIP Entity 2:** Select the name of the other system from the drop-down menu (**Section 6.5**).
- **Port:** Port number on which the other system receives SIP requests from Session Manager (**Section 5.6**).
- **Connection Policy:** Select **Trusted** to allow calls from the associated SIP Entity.
- Click **Commit** to save.

The screen below shows the Entity Link to Communication Manager. The protocol and ports defined here must match the values used on the Communication Manager signaling group form in **Section 5.6**. *TLS* transport and port *5071* were used.

The screenshot shows the Avaya Aura System Manager 7.0 interface. The left navigation pane is expanded to 'Routing', and 'Entity Links' is selected. The main content area shows the 'Entity Links' configuration page with a table containing one item. The table columns are: Name, SIP Entity 1, Protocol, Port, SIP Entity 2, DNS Override, Port, and Connection Policy. The values for the single row are: *Session_Manager_Ck, *Session Manager, TLS, *5071, *Communication Manager Trunk 2, [unchecked], *5071, and trusted. The interface also includes a 'Commit' button and a 'Cancel' button.

Name	SIP Entity 1	Protocol	Port	SIP Entity 2	DNS Override	Port	Connection Policy
*Session_Manager_Ck	*Session Manager	TLS	*5071	*Communication Manager Trunk 2	<input type="checkbox"/>	*5071	trusted

The Entity Link to the Avaya SBCE is shown below; *TLS* transport and port *5061* were used.

The screenshot shows the Avaya Aura System Manager 7.0 interface. The left sidebar contains a navigation menu with 'Entity Links' selected. The main content area is titled 'Entity Links' and contains a table with one item. The table columns are: Name, SIP Entity 1, Protocol, Port, SIP Entity 2, DNS Override, Port, and Connection Policy. The row data is: Name: *Session_Manager_AS, SIP Entity 1: *Q Session Manager, Protocol: TLS, Port: *5061, SIP Entity 2: *Q Avaya SBCE, DNS Override: , Port: *5061, Connection Policy: trusted. There are 'Commit' and 'Cancel' buttons at the top right of the table area.

Name	SIP Entity 1	Protocol	Port	SIP Entity 2	DNS Override	Port	Connection Policy
*Session_Manager_AS	*Q Session Manager	TLS	*5061	*Q Avaya SBCE	<input type="checkbox"/>	*5061	trusted

6.7. Routing Policies

Routing policies describe the conditions under which calls will be routed to the SIP Entities specified in **Section 6.5**. Two routing policies were added: an incoming policy with Communication Manager as the destination, and an outbound policy to the Avaya SBCE. To add a routing policy, navigate to **Routing** → **Routing Policies** in the left navigation pane and click on the **New** button in the right pane (not shown). The following screen is displayed:

- In the **General** section, enter a descriptive **Name** and add a brief description under **Notes** (optional).
- In the **SIP Entity as Destination** section, click **Select**. The **SIP Entity List** page opens (not shown). Choose the appropriate SIP entity to which this routing policy applies (**Section 6.5**) and click **Select**. The selected SIP Entity displays on the **Routing Policy Details** page as shown below.
- Use default values for remaining fields.
- Click **Commit** to save.

The following screens show the Routing Policies for Communication Manager and the Avaya SBCE.

* Retries: 0

Notes: For inbound calls to CM via Trunk

SIP Entity as Destination

Select

Name	FQDN or IP Address	Type	Notes
Communication Manager Trunk 2	10.64.101.241	CM	Used for SP Testing

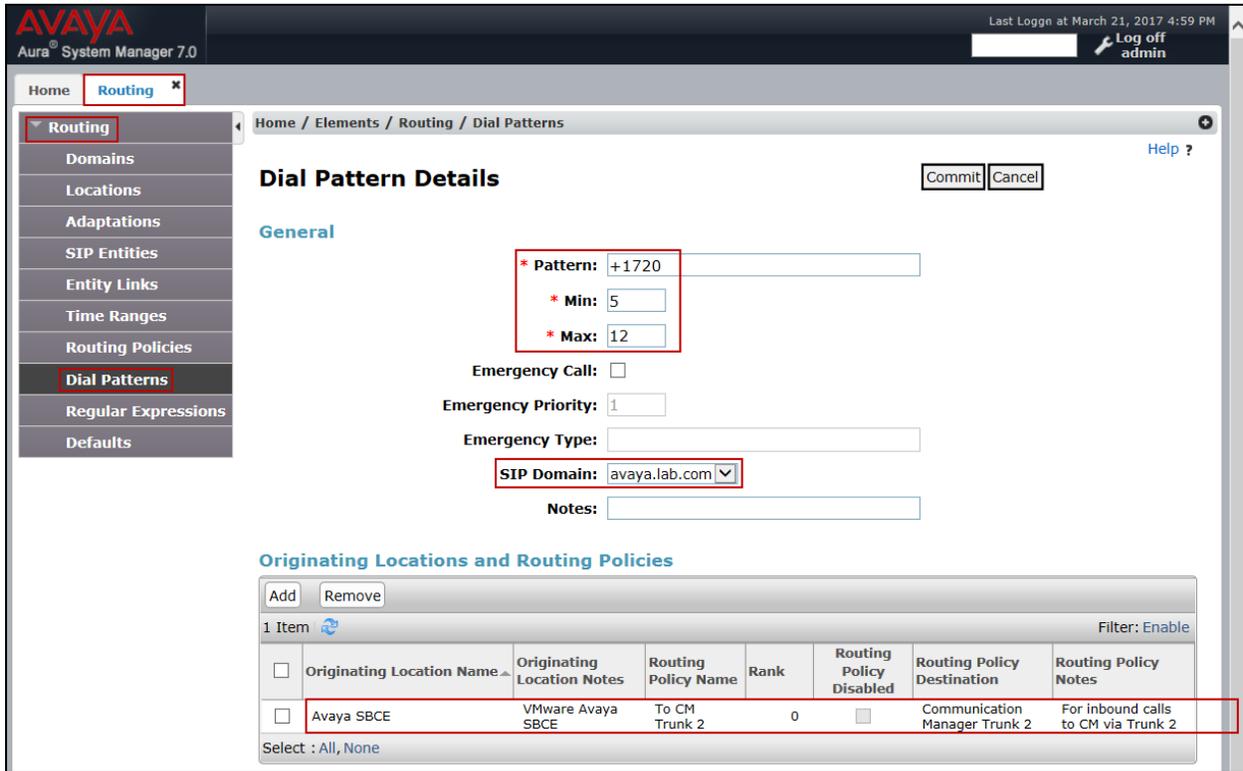

6.8. Dial Patterns

Dial Patterns are needed to route specific calls through Session Manager. For the compliance test, dial patterns were needed to route calls from Communication Manager to the service provider and vice versa. Dial Patterns define which route policy will be selected for a particular call based on the dialed digits, destination domain and originating location. To add a dial pattern, navigate to **Routing** → **Dial Patterns** in the left navigation pane and click on the **New** button in the right pane (not shown). Fill in the following, as shown in the screens below:

In the **General** section, enter the following values:

- **Pattern:** Enter a dial string that will be matched against the Request-URI of the call.
- **Min:** Enter a minimum length used in the match criteria.
- **Max:** Enter a maximum length used in the match criteria.
- **SIP Domain:** Enter the destination domain used in the match criteria, or select “**ALL**” to route incoming calls to all SIP domains.
- **Notes:** Add a brief description (optional).
- In the **Originating Locations and Routing Policies** section, click **Add**. From the **Originating Locations and Routing Policy List** that appears (not shown), select the appropriate originating location for use in the match criteria (**Section 6.3**).
- Lastly, select the routing policy from the list that will be used to route all calls that match the specified criteria (**Section 6.7**). Click **Select** (not shown).
- Click **Commit** to save.

The following screen illustrates an example dial pattern used to verify inbound PSTN calls to the enterprise. In the example, calls to 12 digit numbers starting with +1720, the area code assigned to the DID numbers provided by IntelPeer, including the + and the 1 at the beginning, arriving from location *Avaya SBCE*, used route policy *Communication Manager trunk 2* to Communication Manager.

Repeat this procedure as needed to define additional dial patterns for other range of numbers assigned by the service provider to the enterprise, to be routed to Communication Manager.

The example in this screen shows the 11 digit dialed numbers for outbound calls, beginning with *1*, arriving from the *Communication Manager* location, will use route policy *Avaya SBCE*, which sends the call out to the PSTN via Avaya SBCE and the service provider SIP Trunk. The SIP Domain was set to *avaya.lab.com*.

Dial Pattern Details

General

* Pattern: 1
 * Min: 11
 * Max: 11

Emergency Call:
 Emergency Priority: 1
 Emergency Type:
 SIP Domain: avaya.lab.com
 Notes:

Originating Locations and Routing Policies

Originating Location Name	Originating Location Notes	Routing Policy Name	Rank	Routing Policy Disabled	Routing Policy Destination	Routing Policy Notes
<input type="checkbox"/> Communication Manager	VMware Communication Manager	Avaya SBCE	0	<input type="checkbox"/>	Avaya SBCE	For outbound calls to SP via ASBCE

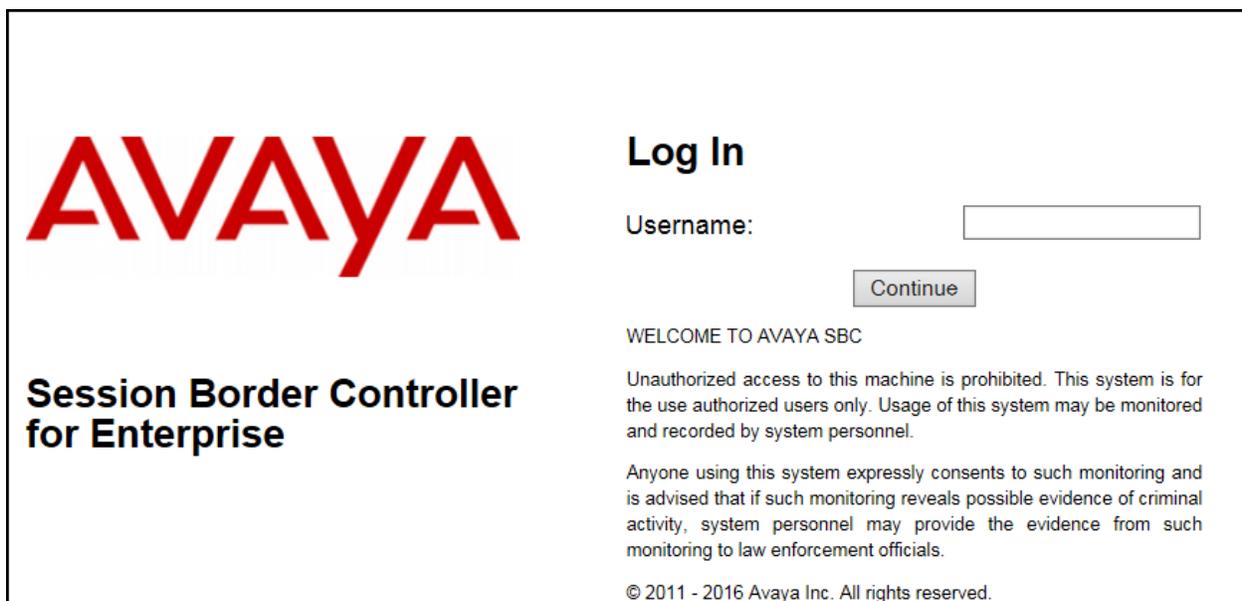

Repeat this procedure as needed, to define additional dial patterns for PSTN numbers to be routed to the service provider’s network via the Avaya SBCE.

7. Configure Avaya Session Border Controller for Enterprise

This section describes the configuration of the Avaya SBCE. It is assumed that the initial installation of the Avaya SBCE, the assignment of the management interface IP Address and license installation have already been completed; hence these tasks are not covered in these Application Notes. For more information on the installation and initial provisioning of the Avaya SBCE consult the Avaya SBCE documentation in the **Additional References** section.

7.1. System Access

Access the Session Border Controller web management interface by using a web browser and entering the URL **https://<ip-address>**, where **<ip-address>** is the management IP address configured at installation. Log in using the appropriate credentials.

The screenshot shows the login interface for the Avaya Session Border Controller for Enterprise. On the left, the Avaya logo is displayed in red, with the text "Session Border Controller for Enterprise" below it. On the right, the "Log In" section contains a "Username:" label, a text input field, and a "Continue" button. Below the login fields, there is a "WELCOME TO AVAYA SBC" message, a warning about unauthorized access, a consent statement, and a copyright notice for 2011-2016 Avaya Inc.

Once logged in, the Dashboard screen is presented. The left navigation pane contains the different available menu items used for the configuration of the Avaya SBCE. Verify that the status of the **License State** field is **OK**, indicating that a valid license is present. Contact an authorized Avaya sales representative if a license is needed.

7.2. System Management

To view current system information, select **System Management** on the left navigation pane. A list of installed devices is shown in the **Devices** tab on the right pane. In the reference configuration, a single device named *Avaya_SBCE* is shown. The management IP address that was configured during installation is blurred out for security reasons, the current software version is shown. The management IP address needs to be on a subnet separate from the ones used in all other interfaces of the Avaya SBCE, segmented from all VoIP traffic. Verify that the **Status** is *Commissioned*, indicating that the initial installation process of the device has been previously completed, as shown on the screen below.

The screenshot shows the Avaya Session Border Controller for Enterprise System Management interface. The top navigation bar includes Alarms (1), Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header displays 'Session Border Controller for Enterprise' and the AVAYA logo. The left navigation pane lists various system management options, with 'System Management' highlighted. The main content area shows the 'System Management' section with tabs for Devices, Updates, SSL VPN, Licensing, and Key Bundles. The 'Devices' tab is active, displaying a table of installed devices.

Device Name	Management IP	Version	Status						
Avaya_SBCE	[Blurred]	7.1.0.2-01-13249	Commissioned	Reboot	Shutdown	Restart Application	View	Edit	Uninstall

To view the network configuration assigned to the Avaya SBCE, click **View** on the screen above. The **System Information** window is displayed, containing the current device configuration and network settings.

System Information: Avaya_SBCE
X

General Configuration

Appliance Name	Avaya_SBCE
Box Type	SIP
Deployment Mode	Proxy

Device Configuration

HA Mode	No
Two Bypass Mode	No

License Allocation

Standard Sessions Requested: 2000	2000
Advanced Sessions Requested: 2000	2000
Scopia Video Sessions Requested: 500	500
CES Sessions Requested: 0	0
Transcoding Sessions Requested: 0	0
Encryption	<input checked="" type="checkbox"/>

Network Configuration

IP	Public IP	Network Prefix or Subnet Mask	Gateway	Interface
10.64.101.243	10.64.101.243	255.255.255.0	10.64.101.1	A1
				A1
				A1
				B1
				B1
10.10.80.51	10.10.80.51	255.255.255.128	10.10.80.1	B1

DNS Configuration

Primary DNS	8.8.8.8
Secondary DNS	7.7.7.7
DNS Location	DMZ
DNS Client IP	10.10.80.51

Management IP(s)

IP #1 (IPv4)	
--------------	--

The highlighted IP addresses in the **System Information** screen are the ones used for the SIP trunk to IntelPeer, and are the ones relevant to these Application Notes. Other IP addresses assigned to the Avaya SBCE **A1** and **B1** interfaces are used to support remote workers and other SIP trunks, and they are not discussed in this document. Also note that for security purposes, any public IP addresses used during the compliance test have been masked in this document.

In the reference configuration, the private interface of the Avaya SBCE (10.64.101.243) was used to connect to the enterprise network, while its public interface (10.10.80.51) was used to connect to the public network. See **Figure 1**.

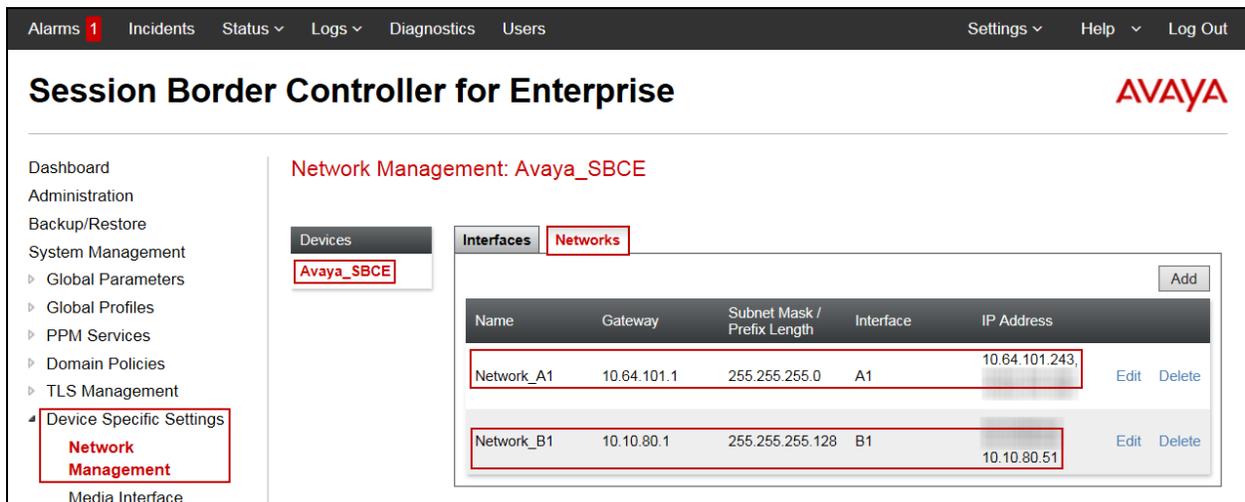

On the **License Allocation** area of the **System Information**, verify that the number of **Standard Sessions** is sufficient to support the desired number of simultaneous SIP calls across all SIP trunks at the enterprise. The number of sessions and encryption features are primarily controlled by the license file installed.

7.3. Network Management

The network configuration parameters should have been previously specified during installation of the Avaya SBCE. In the event that changes need to be made to the network configuration, they can be entered here.

Select **Network Management** from **Device Specific Settings** on the left-side menu. Under **Devices** in the center pane, select the device being managed, **Avaya_SBCE** in the sample configuration. On the **Networks** tab, verify or enter the network information as needed.

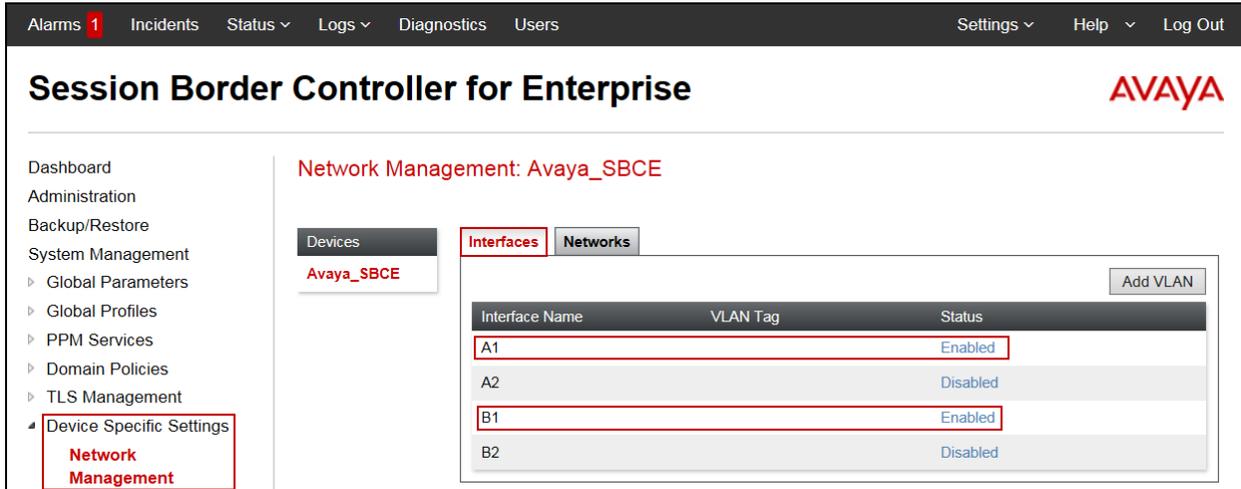

Note that in the configuration used during the compliance test, the IP addresses assigned to the private (**10.64.101.243**) and public (**10.10.80.51**) sides of the Avaya SBCE are the ones relevant to these Application Notes.

The screenshot shows the Avaya SBCE management console. The main heading is "Session Border Controller for Enterprise" with the AVAYA logo. The left sidebar contains a menu with "Device Specific Settings" expanded to show "Network Management". The main content area is titled "Network Management: Avaya_SBCE" and has two tabs: "Interfaces" and "Networks". The "Networks" tab is active, displaying a table with the following data:

Name	Gateway	Subnet Mask / Prefix Length	Interface	IP Address	
Network_A1	10.64.101.1	255.255.255.0	A1	10.64.101.243	Edit Delete
Network_B1	10.10.80.1	255.255.255.128	B1	10.10.80.51	Edit Delete

On the **Interfaces** tab, verify the **Administrative Status** is **Enabled** for the **A1** and **B1** interfaces. Click the buttons under the **Status** column if necessary to enable the interfaces.

7.4. Media Interfaces

Media Interfaces were created to specify the IP address and port range in which the Avaya SBCE will accept media streams on each interface. Packets leaving the interfaces of the Avaya SBCE will advertise this IP address, and one of the ports in this range as the listening IP address and port in which it will accept media from the Call Server or the Trunk Server.

To add the Media Interface in the enterprise direction, select **Media Interface** from the **Device Specific Settings** menu on the left-hand side, select the device being managed and click the **Add** button (not shown).

- On the **Add Media Interface** screen, enter an appropriate **Name** for the Media Interface.
- Under **IP Address**, select from the drop-down menus the network and IP address to be associated with this interface.
- The **Port Range** was left at the default values of **35000-40000**.
- Click **Finish**.

A Media Interface facing the public side was similarly created with the name *Public_med*, as shown below.

- Under **IP Address**, the network and IP address to be associated with this interface was selected.
- The **Port Range** was left at the default values.
- Click **Finish**.

The screenshot shows a dialog box titled "Add Media Interface" with a close button (X) in the top right corner. The dialog contains the following fields:

- Name:** A text input field containing "Public_med".
- IP Address:** A dropdown menu showing "Network_B1 (B1, VLAN 0)" with a downward arrow. Below it, a sub-dropdown menu shows "10.10.80.51" with a downward arrow.
- Port Range:** Two text input fields containing "35000" and "40000" separated by a hyphen.

A "Finish" button is located at the bottom center of the dialog. A red rectangular box highlights the Name, IP Address, and Port Range fields.

7.5. Signaling Interfaces

Signaling Interfaces are created to specify the IP addresses and ports in which the Avaya SBCE will listen for signaling traffic in the connected networks.

To add the Signaling Interface in the enterprise direction, select **Signaling Interface** from the **Device Specific Settings** menu on the left-hand side, select the device being managed and click the **Add** button (not shown).

- On the **Add Signaling Interface** screen, enter an appropriate **Name** for the interface.
- Under **IP Address**, select from the drop-down menus the network and IP address to be associated with this interface.
- Enter **5061** for **TLS Port**, since TLS port 5061 is used to listen for signaling traffic from Session Manager in the sample configuration, as defined in **Section 6.6**.
- Select a **TLS Profile** (See Note below).
- Click **Finish**.

The screenshot shows the 'Add Signaling Interface' configuration window. The form is titled 'Add Signaling Interface' and has a close button 'X' in the top right corner. The form contains the following fields and values:

- Name:** Private_sig
- IP Address:** Network_A1 (A1, VLAN 0) (dropdown), 10.64.101.243 (dropdown)
- TCP Port:** (text box), Leave blank to disable
- UDP Port:** (text box), Leave blank to disable
- TLS Port:** 5061 (text box), Leave blank to disable
- TLS Profile:** NewRemoteWorkerServerProfile (dropdown)
- Enable Shared Control:**
- Shared Control Port:** (text box)

A 'Finish' button is located at the bottom center of the form.

Note - As previously mentioned, the configuration tasks required to support TLS transport for signaling and SRTP for media inside of the enterprise (private network side) are beyond the scope of these Application Notes; hence they are not discussed in this document

A second Signaling Interface with the name **Public_sig** was similarly created in the service provider's direction.

- Under **IP Address**, select from the drop-down menus the network and IP address to be associated with this interface.
- Enter **5060** for **UDP Port**, since this is the protocol and port used by the Avaya SBCE to listen to the service provider's SIP traffic.
- Click **Finish**.

7.6. Server Interworking

Interworking Profile features are configured to facilitate the interoperability between the enterprise SIP-enabled solution (Call Server) and the SIP trunk service provider (Trunk Server).

7.6.1. Server Interworking Profile – Enterprise

Interworking profiles can be created by cloning one of the pre-defined default profiles, or by adding a new profile. To configure the interworking profile in the enterprise direction, select **Global Profiles** → **Server Interworking** on the left navigation pane. Under **Interworking Profiles**, select *avaya-ru* from the list of pre-defined profiles. Click **Clone**.

The screenshot shows the Avaya Session Border Controller for Enterprise web interface. The top navigation bar includes Alarms (1), Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header displays "Session Border Controller for Enterprise" and the AVAYA logo. The left navigation pane is expanded to "Global Profiles" > "Server Interworking". The main content area is titled "Interworking Profiles: avaya-ru" and features an "Add" button and a "Clone" button. A warning message states: "It is not recommended to edit the defaults. Try cloning or adding a new profile instead." Below this, there are tabs for "General", "Timers", "Privacy", "URI Manipulation", "Header Manipulation", and "Advanced". The "General" tab is active, showing a table of configuration parameters:

General	
Hold Support	NONE
180 Handling	None
181 Handling	None
182 Handling	None
183 Handling	None
Refer Handling	No
URI Group	None
Send Hold	No
Delayed Offer	No
3xx Handling	No
Diversion Header Support	No
Delayed SDP Handling	No
Re-Invite Handling	No

- Enter a descriptive name for the cloned profile.
- Click **Finish**.

The "Clone Profile" dialog box is shown with the following fields:

- Profile Name: avaya-ru
- Clone Name: Avaya-SM (highlighted with a red box)

A "Finish" button is located at the bottom of the dialog.

Click **Edit** on the newly cloned *Avaya-SM* interworking profile:

- On the **General** tab, check *T.38 Support*.
- Leave remaining fields with default values.
- Click **Finish**.

The screenshot shows a dialog box titled "Editing Profile: Avaya-SM" with a close button (X) in the top right corner. The "General" tab is selected. The following options are visible:

- Hold Support: None, RFC2543 - c=0.0.0.0, RFC3264 - a=sendonly
- 180 Handling: None, SDP, No SDP
- 181 Handling: None, SDP, No SDP
- 182 Handling: None, SDP, No SDP
- 183 Handling: None, SDP, No SDP
- Refer Handling:
- URI Group: None (dropdown)
- Send Hold:
- Delayed Offer:
- 3xx Handling:
- Diversion Header Support:
- Delayed SDP Handling:
- Re-Invite Handling:
- Prack Handling:
- Allow 18X SDP:
- T.38 Support:** (highlighted with a red box)
- URI Scheme: SIP, TEL, ANY
- Via Header Format: RFC3261, RFC2543

A "Finish" button is located at the bottom center of the dialog.

The **Timers**, **Privacy**, **URI Manipulation** and **Header Manipulation** tabs contain no entries. The **Advanced** tab settings are shown on the screen below:

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The top navigation bar includes 'Alarms 1', 'Incidents', 'Status', 'Logs', 'Diagnostics', 'Users', 'Settings', 'Help', and 'Log Out'. The main header shows 'Session Border Controller for Enterprise' and the 'AVAYA' logo.

The left sidebar contains a navigation menu with categories like 'Dashboard', 'Administration', 'System Management', 'Global Parameters', 'Global Profiles', 'Domain DoS', 'Media Forking', 'Routing', 'Server Configuration', 'Topology Hiding', 'Signaling Manipulation', 'URI Groups', 'SNMP Traps', 'Time of Day Rules', 'FGDN Groups', 'Reverse Proxy Policy', and 'PPM Services'. The 'Global Profiles' section is expanded, and 'Avaya-SM' is selected.

The main content area is titled 'Interworking Profiles: Avaya-SM'. It features an 'Add' button and 'Rename', 'Clone', and 'Delete' buttons. A blue bar prompts the user to 'Click here to add a description.' Below this, there are tabs for 'General', 'Timers', 'Privacy', 'URI Manipulation', 'Header Manipulation', and 'Advanced'. The 'Advanced' tab is active, showing a table of settings:

Setting	Value
Record Routes	Both Sides
Include End Point IP for Context Lookup	Yes
Extensions	Avaya
Diversion Manipulation	No
Has Remote SBC	Yes
Route Response on Via Port	No
Relay INVITE Replace for SIPREC	No

Below the table, there is a 'DTMF' section with a table:

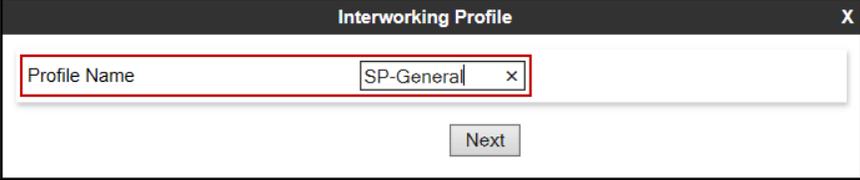

Setting	Value
DTMF Support	None

An 'Edit' button is located at the bottom right of the settings area.

7.6.2. Server Interworking Profile – Service Provider

A second interworking profile in the direction of the SIP trunk was created, by adding a new profile in this case. Select **Global Profiles** → **Server Interworking** on the left navigation pane and click **Add** (not shown).

- Enter a descriptive name for the new profile.
- Click **Next**.

The screenshot shows a web-based configuration window titled "Interworking Profile". The window has a dark header bar with the title and a close button "X". Below the header, there is a text input field with the label "Profile Name" and the text "SP-General" entered. A small "x" icon is visible to the right of the input field. Below the input field, there is a "Next" button.

- On the **General** tab, check **T.38 Support**. Click **Next**, then click **Finish** on the last tab leaving remaining fields with default values (not shown).

The screenshot shows the 'Interworking Profile' configuration window with the 'General' tab selected. The 'T.38 Support' checkbox is checked and highlighted with a red box. The following table summarizes the configuration options shown in the window:

Option	Value
Hold Support	None
180 Handling	None
181 Handling	None
182 Handling	None
183 Handling	None
Refer Handling	Unchecked
URI Group	None
Send Hold	Checked
Delayed Offer	Checked
3xx Handling	Unchecked
Diversion Header Support	Unchecked
Delayed SDP Handling	Unchecked
Re-Invite Handling	Unchecked
Prack Handling	Unchecked
Allow 18X SDP	Unchecked
T.38 Support	Checked
URI Scheme	SIP
Via Header Format	RFC3261

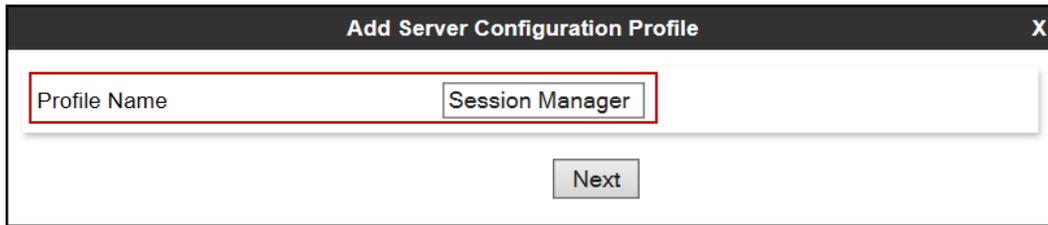

7.7. Server Configuration

Server Profiles are created to define the parameters for the Avaya SBCE peers; Session Manager (Call Server) at the enterprise and IntelPeer SIP Proxy (Trunk Server).

7.7.1. Server Configuration Profile – Enterprise

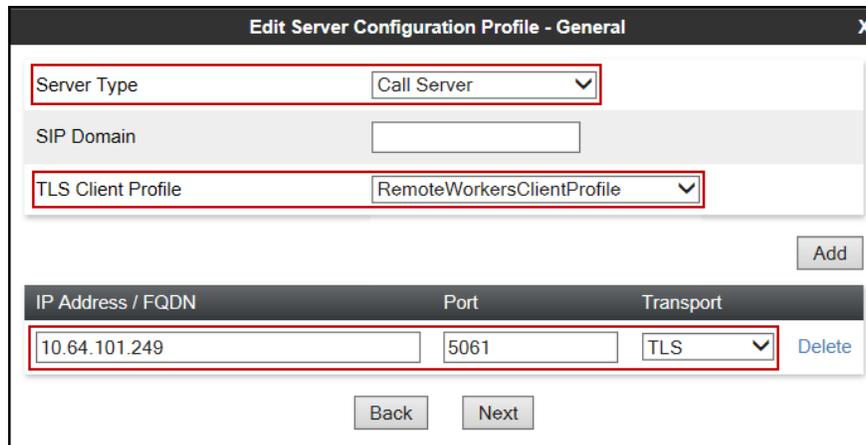

From the **Global Profiles** menu on the left-hand navigation pane, select **Server Configuration** and click the **Add** button (not shown) to add a new profile for the Call Server.

- Enter an appropriate **Profile Name** similar to the screen below.
- Click **Next**.

The screenshot shows a dialog box titled "Add Server Configuration Profile" with a close button (X) in the top right corner. Inside the dialog, there is a text input field labeled "Profile Name" containing the text "Session Manager". Below the input field is a "Next" button.

- On the **Edit Server Configuration Profile – General** tab select *Call Server* from the drop down menu under the **Server Type**.
- On the **IP Addresses / FQDN** field, enter the IP address of the Session Manager Security Module (**Section 6.5**).
- Enter **5061** under **Port** and select **TLS** for **Transport**. The transport protocol and port selected here must match the values defined for the Entity Link to the Session Manager previously created in **Section 6.6**.
- Select a **TLS Profile**.
- Click **Next**.

The screenshot shows a dialog box titled "Edit Server Configuration Profile - General" with a close button (X) in the top right corner. The dialog contains several fields and buttons:

- Server Type**: A dropdown menu set to "Call Server".
- SIP Domain**: An empty text input field.
- TLS Client Profile**: A dropdown menu set to "RemoteWorkersClientProfile".
- Add**: A button to the right of the TLS Client Profile dropdown.
- IP Address / FQDN**: A text input field containing "10.64.101.249".
- Port**: A text input field containing "5061".
- Transport**: A dropdown menu set to "TLS".
- Delete**: A button to the right of the Transport dropdown.
- Back** and **Next**: Buttons at the bottom of the dialog.

- Click **Next** on the **Authentication** and **Heartbeat** tabs (not shown).
- Select **Avaya-SM** from the **Interworking Profile** drop down menu.
- Click **Finish**.

The screenshot shows a configuration window titled "Add Server Configuration Profile - Advanced". It contains several settings:

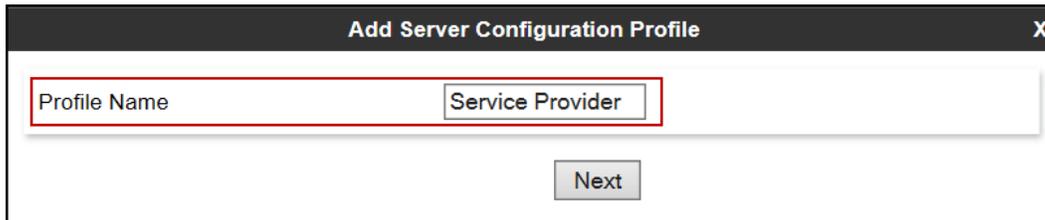

- Enable DoS Protection:
- Enable Grooming:
- Interworking Profile: Avaya-SM (highlighted with a red box)
- Signaling Manipulation Script: None
- Securable:
- Enable FGDN:
- TCP Failover Port: 5060
- TLS Failover Port: 5061

At the bottom, there are two buttons: "Back" and "Finish".

7.7.2. Server Configuration Profile – Service Provider

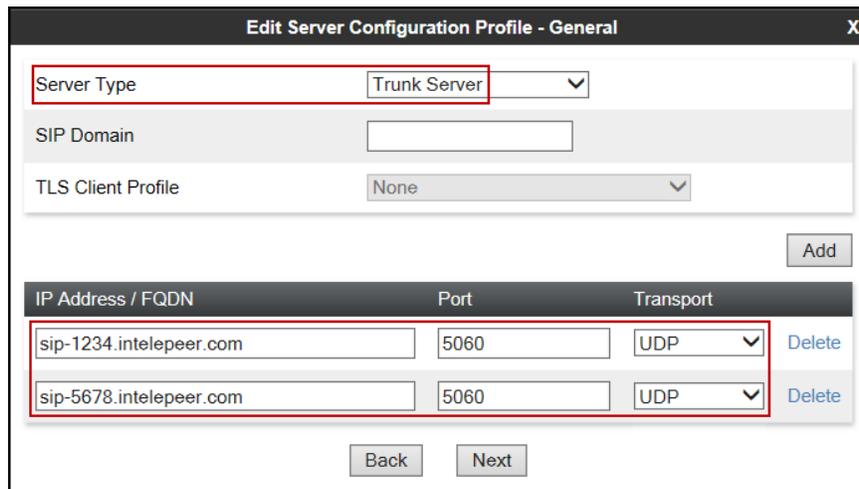

Similarly, to add the profile for the Trunk Server, click the **Add** button on the **Server Configuration** screen (not shown).

- Enter an appropriate **Profile Name** similar to the screen below.
- Click **Next**.

The screenshot shows a dialog box titled "Add Server Configuration Profile". It contains two input fields: "Profile Name" and "Service Provider", both of which are highlighted with red rectangular boxes. Below these fields is a "Next" button.

- On the **Edit Server Configuration Profile - General** Tab select **Trunk Server** from the drop down menu for the **Server Type**.
- On the **IP Addresses / FQDN** field, enter the FQDNs provided by IntelPeer for DNS “A” record queries. For redundancy, two entries were added.
- Enter **5060** under **Port**, and select **UDP** for **Transport** for both entries.
- Click **Next**.

The screenshot shows a dialog box titled "Edit Server Configuration Profile - General". The "Server Type" dropdown menu is set to "Trunk Server" and is highlighted with a red box. Below this, there are fields for "SIP Domain" and "TLS Client Profile" (set to "None"). An "Add" button is located to the right of the "TLS Client Profile" field. Below these fields is a table with three columns: "IP Address / FQDN", "Port", and "Transport". The table contains two entries, both highlighted with a red box:

IP Address / FQDN	Port	Transport	
sip-1234.intelepeer.com	5060	UDP	Delete
sip-5678.intelepeer.com	5060	UDP	Delete

At the bottom of the dialog box are "Back" and "Next" buttons.

- Click **Next** on the **Authentication** and **Heartbeat** tab (not shown).

- On the **Advanced** tab, select **SP-General** from the **Interworking Profile** drop down menu.
- Click **Finish**.

Add Server Configuration Profile - Advanced X

Enable DoS Protection	<input type="checkbox"/>
Enable Grooming	<input type="checkbox"/>
Interworking Profile	SP-General ▼
Signaling Manipulation Script	None ▼
Securable	<input type="checkbox"/>
Enable FGDN	<input type="checkbox"/>
TCP Failover Port	5060
TLS Failover Port	5061

Back Finish

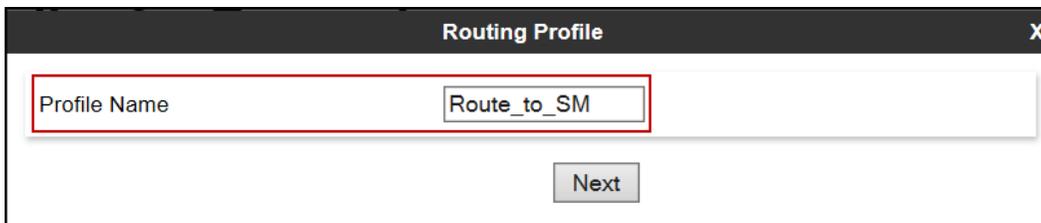

7.8. Routing

Routing profiles define a specific set of routing criteria that is used, in addition to other types of domain policies, to determine the path that the SIP traffic will follow as it flows through the Avaya SBCE interfaces. Two Routing Profiles were created in the test configuration, one for inbound calls, with Session Manager as the destination, and the second one for outbound calls, which are routed to the service provider SIP trunk.

7.8.1. Routing Profile – Enterprise

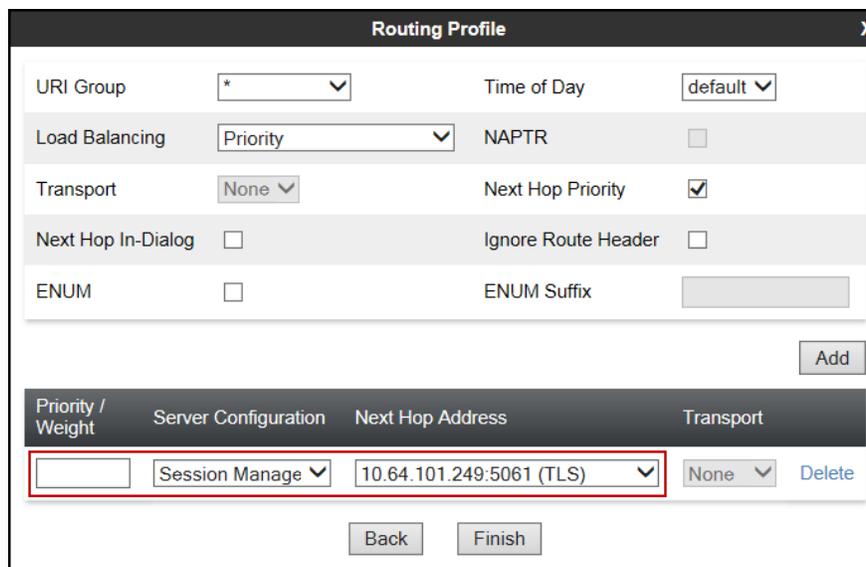

To create the inbound route, select the **Routing** tab from the **Global Profiles** menu on the left-hand side and select **Add** (not shown).

- Enter an appropriate **Profile Name** similar to the example below.
- Click **Next**.

The screenshot shows a window titled "Routing Profile" with a close button (X) in the top right corner. Below the title bar is a text input field labeled "Profile Name" containing the text "Route_to_SM". A red rectangular box highlights this field. Below the input field is a "Next" button.

- On the **Routing Profile** tab, click the **Add** button to enter the next-hop address.
- Under **Server Configuration**, select *Session Manager*. The **Next Hop Address** field will be populated with the IP address, port and protocol defined for the Session Manager Server Configuration Profile in **Section 7.7.1**.
- Defaults were used for all other parameters.
- Click **Finish**.

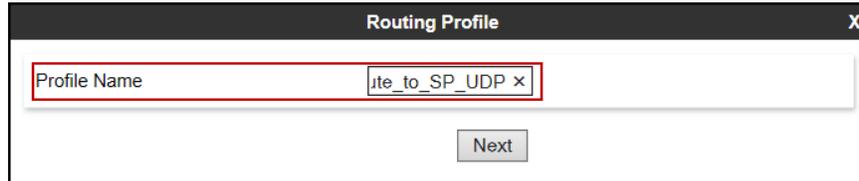

The screenshot shows a window titled "Routing Profile" with a close button (X) in the top right corner. The window contains several configuration fields and a table. The fields are: URI Group (set to *), Time of Day (set to default), Load Balancing (set to Priority), NAPTR (checkbox), Transport (set to None), Next Hop Priority (checkbox checked), Next Hop In-Dialog (checkbox), Ignore Route Header (checkbox), ENUM (checkbox), and ENUM Suffix (text field). Below these fields is an "Add" button. Below the "Add" button is a table with the following columns: Priority / Weight, Server Configuration, Next Hop Address, and Transport. The table has one row with the following values: Priority / Weight (empty), Server Configuration (Session Manager), Next Hop Address (10.64.101.249:5061 (TLS)), and Transport (None). A red rectangular box highlights the first row of the table. Below the table are "Back" and "Finish" buttons.

7.8.2. Routing Profile – Service Provider

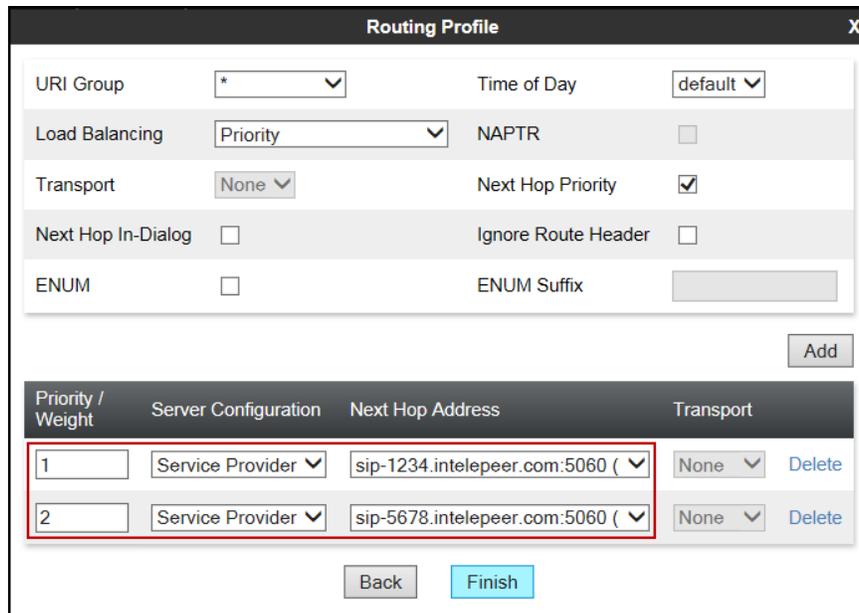

Back at the **Routing** tab, select **Add** (not shown) to repeat the process in order to create the outbound route.

- Enter an appropriate **Profile Name** similar to the example below.
- Click **Next**.

The screenshot shows a dialog box titled "Routing Profile" with a close button (X) in the top right corner. Inside the dialog, there is a text input field labeled "Profile Name" containing the text "ite_to_SP_UDP". To the right of the input field is a small "X" icon. Below the input field is a "Next" button.

- On the **Routing Profile** tab, click the **Add** button to enter the next-hop address. On the first entry, enter **1** under **Priority/Weight**. Under **Server Configuration**, select the first FQDN created in **Section 7.7.2** for DNS “A” record queries. The **Next Hop Address** field will be populated with the IP address, port and protocol defined for the Service Provider Server Configuration Profile in **Section 7.7.2**.
- Repeat by selecting the second FQDN created in **Section 7.7.2** for DNS “A” record queries. Enter **2** under **Priority/Weight**.
- Defaults were used for all other parameters.
- Click **Finish**.

The screenshot shows the "Routing Profile" dialog box with various configuration options and a table of entries. The options are:

- URI Group: *
- Time of Day: default
- Load Balancing: Priority
- NAPTR:
- Transport: None
- Next Hop Priority:
- Next Hop In-Dialog:
- Ignore Route Header:
- ENUM:
- ENUM Suffix: (empty field)

Below the options is an "Add" button. The table below has the following columns: Priority / Weight, Server Configuration, Next Hop Address, and Transport. The entries are:

Priority / Weight	Server Configuration	Next Hop Address	Transport
1	Service Provider	sip-1234.intelepeer.com:5060 (None
2	Service Provider	sip-5678.intelepeer.com:5060 (None

At the bottom of the dialog are "Back" and "Finish" buttons.

7.9. Topology Hiding

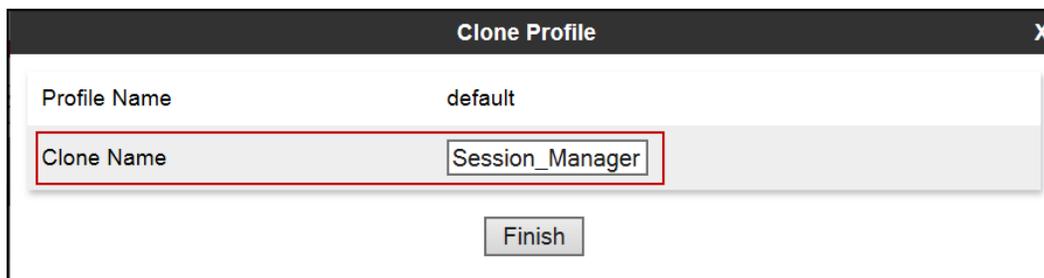

Topology Hiding is a security feature that allows the modification of several SIP headers, preventing private enterprise network information from being propagated to the untrusted public network.

Topology Hiding can also be used as an interoperability tool to adapt the host portion in the SIP headers to the IP addresses or domains expected on the service provider and the enterprise networks. For the compliance test, the default Topology Hiding Profile was cloned and modified accordingly. Only the minimum configuration required to achieve interoperability on the SIP trunk was performed. Additional steps can be taken in this section to further mask the information that is sent from the enterprise to the public network.

7.9.1. Topology Hiding Profile – Enterprise

To add the Topology Hiding Profile in the enterprise direction, select **Topology Hiding** from the **Global Profiles** menu on the left-hand side, select *default* from the list of pre-defined profiles and click the **Clone** button (not shown).

- Enter a **Clone Name** such as the one shown below.
- Click **Finish**.

The screenshot shows a dialog box titled "Clone Profile" with a close button (X) in the top right corner. Inside the dialog, there are two input fields. The first field is labeled "Profile Name" and contains the text "default". The second field is labeled "Clone Name" and contains the text "Session_Manager"; this field is highlighted with a red rectangular border. Below the input fields is a button labeled "Finish".

On the newly cloned *Session_Manager* profile screen, click the **Edit** button (not shown).

- For the, **From**, **To** and **Request-Line** headers, select **Overwrite** in the **Replace Action** column and enter the enterprise SIP domain *avaya.lab.com*, in the **Overwrite Value** column of these headers, as shown below. This is the domain known by Session Manager, defined in **Section 6.2**.
- Default values were used for all other fields.
- Click **Finish**.

Header	Criteria	Replace Action	Overwrite Value	
SDP	IP/Domain	Auto		Delete
To	IP/Domain	Overwrite	avaya.lab.com	Delete
From	IP/Domain	Overwrite	avaya.lab.com	Delete
Refer-To	IP/Domain	Auto		Delete
Via	IP/Domain	Auto		Delete
Record-Route	IP/Domain	Auto		Delete
Request-Line	IP/Domain	Overwrite	avaya.lab.com	Delete
Referred-By	IP/Domain	Auto		Delete

7.9.2. Topology Hiding Profile – Service Provider

A Topology Hiding profile named *Service_Provider* was similarly created in the direction of the SIP trunk to the service provider. During the compliance test, IP addresses and not domains names were used in all SIP messages between the service provider and the Avaya SBCE. Note that since the default action of *Auto* implies the insertion of IP addresses in the host portion of these headers, it was not necessary to modify any of the headers sent to the service provider. The screen below shows the *Service_Provider* profile once the configuration was completed.

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The top navigation bar includes 'Alarms 1', 'Incidents', 'Status', 'Logs', 'Diagnostics', 'Users', 'Settings', 'Help', and 'Log Out'. The main header shows 'Session Border Controller for Enterprise' and the 'AVAYA' logo. A left-hand navigation menu lists various system management options, with 'Global Profiles' expanded to show 'Topology Hiding' selected. The main content area is titled 'Topology Hiding Profiles: Service_Provider' and features an 'Add' button, 'Rename', 'Clone', and 'Delete' buttons. Below this is a table for the 'Topology Hiding' profile configuration.

Header	Criteria	Replace Action	Overwrite Value
SDP	IP/Domain	Auto	---
To	IP/Domain	Auto	---
From	IP/Domain	Auto	---
Refer-To	IP/Domain	Auto	---
Via	IP/Domain	Auto	---
Record-Route	IP/Domain	Auto	---
Request-Line	IP/Domain	Auto	---
Referred-By	IP/Domain	Auto	---

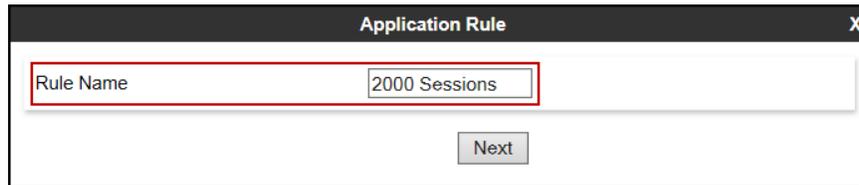

7.10. Domain Policies

Domain Policies allow the configuration of sets of rules designed to control and normalize the behavior of call flows, based upon various criteria of communication sessions originating from or terminating in the enterprise. Domain Policies include rules for Application, Media, Signaling, Security, etc.

7.10.1. Application Rules

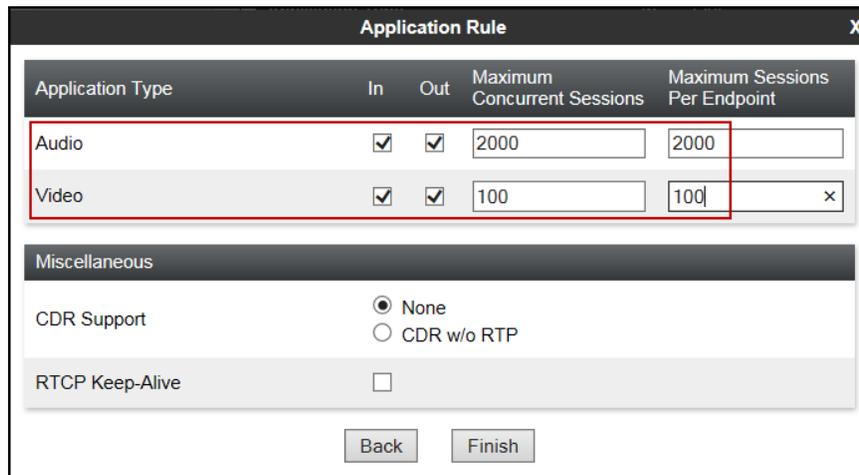

Application Rules define which types of SIP-based Unified Communications (UC) applications the UC-Sec security device will protect: voice, video, and/or Instant Messaging (IM). In addition, Application Rules define the maximum number of concurrent voice and video sessions the network will process in order to prevent resource exhaustion. From the menu on the left-hand side, select **Domain Policies** → **Application Rules**, Click on the **Add** button to add a new rule.

- Under **Rule Name** enter the name of the profile, e.g., *2000 Sessions*.
- Click **Next**.

The screenshot shows a window titled "Application Rule" with a close button (X) in the top right corner. Below the title bar is a text input field labeled "Rule Name" containing the text "2000 Sessions". Below the input field is a "Next" button.

- Under **Audio** check *In* and *Out* and set the **Maximum Concurrent Sessions** and **Maximum Sessions Per Endpoint** to recommended values, the values of *2000* for Audio and *100* for Video were used in the sample configuration.
- Click **Finish**.

The screenshot shows a window titled "Application Rule" with a close button (X) in the top right corner. Below the title bar is a table with the following columns: "Application Type", "In", "Out", "Maximum Concurrent Sessions", and "Maximum Sessions Per Endpoint". The table has two rows: "Audio" and "Video". The "Audio" row has "In" and "Out" checked, "Maximum Concurrent Sessions" set to "2000", and "Maximum Sessions Per Endpoint" set to "2000". The "Video" row has "In" and "Out" checked, "Maximum Concurrent Sessions" set to "100", and "Maximum Sessions Per Endpoint" set to "100". Below the table is a "Miscellaneous" section with three options: "CDR Support" (radio buttons for "None" and "CDR w/o RTP"), and "RTCP Keep-Alive" (checkbox). At the bottom are "Back" and "Finish" buttons.

Application Type	In	Out	Maximum Concurrent Sessions	Maximum Sessions Per Endpoint
Audio	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	2000	2000
Video	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	100	100

7.10.2. Media Rules

Media Rules allow one to define RTP media packet parameters such as prioritizing encryption techniques and packet encryption techniques. Together these media-related parameters define a strict profile that is associated with other SIP-specific policies to determine how media packets matching these criteria will be handled by the Avaya SBCE security product. For the compliance test, two media rules (shown below) were used; one toward Session Manager and one toward the Service Provider.

To add a media rule in the Session Manager direction, from the menu on the left-hand side, select **Domain Policies → Media Rules**.

- Click on the **Add** button to add a new media rule (not shown).
- Under **Rule Name** enter **SM_SRTP**.
- Click **Next** (not shown).
- Under Audio Encryption, **Preferred Format #1**, select **SRTP_AES_CM_128_HMAC_SHA1_80**.
- Under Audio Encryption, **Preferred Format #2**, select **SRTP_AES_CM_128_HMAC_SHA1_32**.
- Under Audio Encryption, **Preferred Format #3**, select **RTP**.
- Under Audio Encryption, uncheck **Encrypted RTCP**.
- Under Audio Encryption, check **Interworking**.
- Repeat the above steps under Video Encryption.
- Under Miscellaneous verify that **Capability Negotiation** is checked.
- Click **Next**.

Media Encryption X

Audio Encryption

Preferred Format #1	SRTP_AES_CM_128_HMAC_SHA1_80 ▼
Preferred Format #2	SRTP_AES_CM_128_HMAC_SHA1_32 ▼
Preferred Format #3	RTP ▼
Encrypted RTCP	<input type="checkbox"/>
MKI	<input type="checkbox"/>
Lifetime <small>Leave blank to match any value.</small>	2^ <input type="text"/>
Interworking	<input checked="" type="checkbox"/>

Video Encryption

Preferred Format #1	SRTP_AES_CM_128_HMAC_SHA1_80 ▼
Preferred Format #2	SRTP_AES_CM_128_HMAC_SHA1_32 ▼
Preferred Format #3	RTP ▼
Encrypted RTCP	<input type="checkbox"/>
MKI	<input type="checkbox"/>

Miscellaneous

Capability Negotiation	<input checked="" type="checkbox"/>
------------------------	-------------------------------------

- Accept default values in the remaining sections by clicking **Next** (not shown), and then click **Finish** (not shown).

For the compliance test, the **default-low-med** Media Rule was used in the Service Provider direction.

The screenshot shows the Avaya Session Border Controller for Enterprise interface. The top navigation bar includes Alarms (1), Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header reads "Session Border Controller for Enterprise" with the AVAYA logo. On the left, a navigation menu lists various system management options, with "Domain Policies" and "Media Rules" highlighted. The main content area is titled "Media Rules: default-low-med" and features a list of rules on the left, including "default-low-med", "default-high", "default-high-enc", "avaya-low-med...", "Rem_Workers...", "IPO_SRTP", "ServiceProvider...", and "SM_SRTP". The "default-low-med" rule is selected. The main configuration area shows a warning: "It is not recommended to edit the defaults. Try cloning or adding a new rule instead." Below this, there are tabs for "Encryption", "Codec Prioritization", "Advanced", and "QoS". The "Encryption" tab is active, showing settings for Audio Encryption (Preferred Formats: RTP, Interworking: checked) and Video Encryption (Preferred Formats: RTP, Interworking: checked). There is also a "Miscellaneous" section with "Capability Negotiation" (unchecked). An "Edit" button is located at the bottom right of the configuration area.

7.10.3. Signaling Rules

For the compliance test, the **default** signaling rule was used.

The screenshot shows the Avaya Session Border Controller for Enterprise interface. The top navigation bar includes Alarms (1), Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header reads "Session Border Controller for Enterprise" with the AVAYA logo. On the left, a navigation menu lists various system management options, with "Domain Policies" and "Signaling Rules" highlighted. The main content area is titled "Signaling Rules: default" and features a list of rules on the left, including "default", "No-Content-Typ...", "SessMgr_CM_S...", "OPTIONS", "Remote Workers", "Remove_Update", "Contact", "Remove PAI", "Remove PAI_1", and "Remove_headers". The "default" rule is selected. The main configuration area shows a warning: "It is not recommended to edit the defaults. Try cloning or adding a new rule instead." Below this, there are tabs for "General", "Requests", "Responses", "Request Headers", "Response Headers", "Signaling QoS", and "UCID". The "General" tab is active, showing settings for Inbound and Outbound requests (Requests: Allow, Non-2XX Final Responses: Allow, Optional Request Headers: Allow, Optional Response Headers: Allow) and Content-Type Policy (Enable Content-Type Checks: checked, Action: Allow, Multipart Action: Allow, Exception List). An "Edit" button is located at the bottom right of the configuration area.

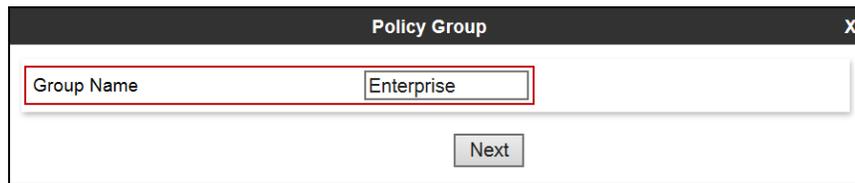

7.11. End Point Policy Groups

End Point Policy Groups associate the different sets of rules under Domain Policies (Media, Signaling, Security, etc.) to be applied to specific SIP messages traversing through the Avaya SBCE. Please note that changes should not be made to any of the default rules used in these End Point Policy Groups.

7.11.1. End Point Policy Group – Enterprise

To create an End Point Policy Group for the enterprise, select **End Point Policy Groups** under the **Domain Policies** menu and select **Add** (not shown).

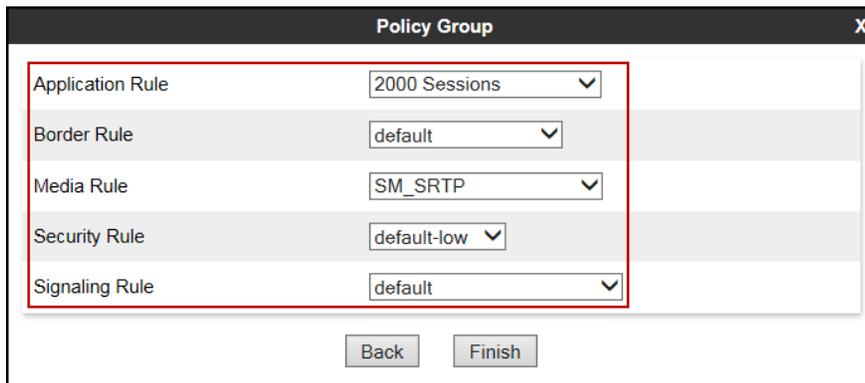

- Enter an appropriate name in the **Group Name** field.
- Click **Next**.

The screenshot shows a dialog box titled "Policy Group" with a close button (X) in the top right corner. Inside the dialog, there is a text input field labeled "Group Name" containing the text "Enterprise". Below the input field is a "Next" button.

Under the **Policy Group** tab enter the following:

- **Application Rule:** *2000 Sessions* (Section 7.10.1).
- **Border Rule:** *default*.
- **Media Rule:** *SM_SRTP* (Section 7.10.2).
- **Security Rule:** *default-low*.
- **Signaling Rule:** *default* (Section 7.10.3).
- Click **Finish**.

The screenshot shows the "Policy Group" dialog box with a close button (X) in the top right corner. The dialog contains five rows of configuration options, each with a label and a dropdown menu. A red box highlights the first five rows. At the bottom of the dialog are "Back" and "Finish" buttons.

Rule Type	Selected Value
Application Rule	2000 Sessions
Border Rule	default
Media Rule	SM_SRTP
Security Rule	default-low
Signaling Rule	default

7.11.2. End Point Policy Group – Service Provider

A second End Point Policy Group was created for the service provider, repeating the steps previously described. In the Policy Group tab, all fields used one of the default sets already pre-defined in the configuration, except for the Application Rule, which was set to **2000 Sessions** (Section 7.10.1).

The screen below shows the End Point Policy Group named **Service Provider** after the configuration was completed.

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The top navigation bar includes 'Alarms 1', 'Incidents', 'Status', 'Logs', 'Diagnostics', 'Users', 'Settings', 'Help', and 'Log Out'. The main header shows 'Session Border Controller for Enterprise' and the 'AVAYA' logo.

The left sidebar contains a navigation menu with the following items: Dashboard, Administration, Backup/Restore, System Management, Global Parameters, Global Profiles, PPM Services, Domain Policies (highlighted), Application Rules, Border Rules, Media Rules, Security Rules, Signaling Rules, End Point Policy Groups (highlighted), Session Policies, TLS Management, and Device Specific Settings.

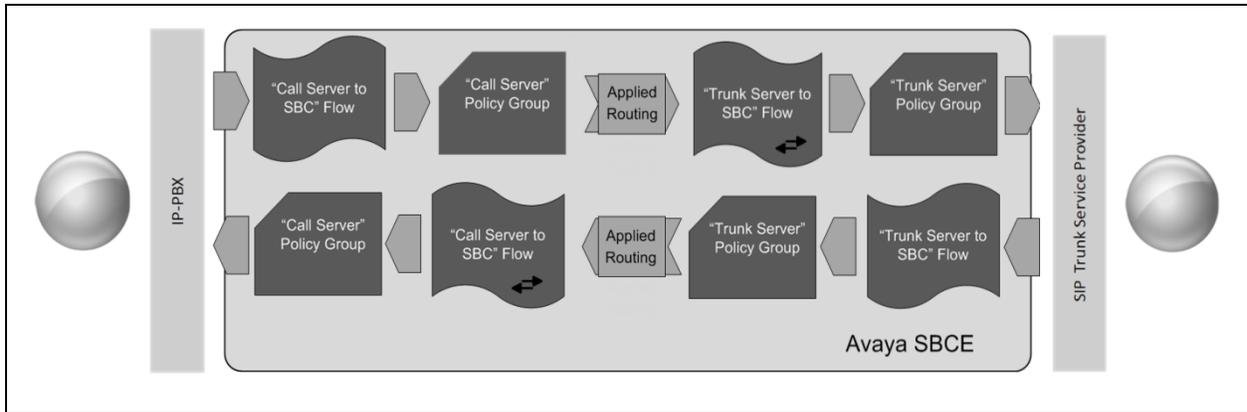

The main content area is titled 'Policy Groups: Service Provider'. It features an 'Add' button, a 'Filter By Device...' dropdown, and 'Rename', 'Clone', and 'Delete' buttons. Below this, there are two blue bars with instructions: 'Click here to add a description.' and 'Hover over a row to see its description.'

A 'Policy Group' table is displayed with a 'Summary' button. The table has the following columns: Order, Application, Border, Media, Security, Signaling, and Edit. The first row is highlighted with a red border and contains the following data:

Order	Application	Border	Media	Security	Signaling	Edit
1	2000 Sessions	default	default-low-med	default-low	default	Edit

7.12. End Point Flows

When a packet is received by Avaya SBCE, the content of the packet (IP addresses, URIs, etc.) is used to determine which flow it matches. Once the flow is determined, the flow points to a policy group which contains several rules concerning processing, privileges, authentication, routing, etc. Once routing is applied and the destination endpoint is determined, the policies for this destination endpoint are applied. The context is maintained, so as to be applied to future packets in the same flow. The following screen illustrates the flow through the Avaya SBCE to secure a SIP Trunk call.

The **End-Point Flows** defines certain parameters that pertain to the signaling and media portions of a call, whether it originates from within the enterprise or outside of the enterprise.

7.12.1. End Point Flow – Enterprise

To create the call flow toward the enterprise, from the **Device Specific** menu, select **End Point Flows**, then select the **Server Flows** tab. Click **Add** (not shown). The screen below shows the flow named *Session_Manager_Flow* created in the sample configuration. The flow uses the interfaces, policies, and profiles defined in previous sections. Note that the **Routing Profile** selection is the profile created for the Service Provider in **Section 7.8.2**, which is the reverse route of the flow. Click **Finish**.

Field	Value
Flow Name	Session_Manager_Flow
Server Configuration	Session Manager
URI Group	*
Transport	*
Remote Subnet	*
Received Interface	Public_sig
Signaling Interface	Private_sig
Media Interface	Private_med
Secondary Media Interface	None
End Point Policy Group	SM_S RTP
Routing Profile	Route_to_SP_UDP
Topology Hiding Profile	Session_Manager
Signaling Manipulation Script	None
Remote Branch Office	Any

Finish

7.12.2. End Point Flow – Service Provider

A second Server Flow with the name *SIP_Trunk_Flow_UDP* was similarly created in the Service Provider direction. The flow uses the interfaces, policies, and profiles defined in previous sections. Note that the **Routing Profile** selection is the profile created for Session Manager in **Section 7.8.1**, which is the reverse route of the flow. Also note that there is no selection under the **Signaling Manipulation Script** field. Click **Finish**.

Edit Flow: SIP_Trunk_Flow_UDP	
Flow Name	SIP_Trunk_Flow_UDP
Server Configuration	Service Provider UDP
URI Group	*
Transport	*
Remote Subnet	*
Received Interface	Private_sig
Signaling Interface	Public_sig
Media Interface	Public_med
Secondary Media Interface	None
End Point Policy Group	Service Provider
Routing Profile	Route_to_SM
Topology Hiding Profile	Service_Provider
Signaling Manipulation Script	None
Remote Branch Office	Any

Finish

8. IntelPeer CoreCloud SIP Trunk Service Configuration

To use IntelPeer CoreCloud SIP Trunk Service, a customer must request the service from IntelPeer using the established sales processes. The process can be started by contacting IntelPeer via the corporate web site at: <http://www.intelepeer.com/voice-services/sip-trunking.html> or call 877-336-9171.

During the sign-up process, IntelPeer and the customer will discuss details about the preferred method to be used to connect the customer's enterprise network to IntelPeer's network. IntelPeer will provide DNS "A" record FQDNs, Direct Inward Dialed (DID) numbers to be assigned to the enterprise, etc. This information is used to complete the Avaya Aura® Communication Manager, Avaya Aura® Session Manager and Avaya Session Border Controller for Enterprise configuration discussed in the previous sections.

9. Verification and Troubleshooting

This section provides verification steps that may be performed in the field to verify that the solution is configured properly. This section also provides a list of commands that can be used to troubleshoot the solution.

9.1. General Verification Steps

- Verify that endpoints at the enterprise site can place calls to the PSTN and that the call remains active for more than 35 seconds. This time period is included to verify that proper routing of the SIP messaging has satisfied SIP protocol timers.
- Verify that endpoints at the enterprise site can receive calls from the PSTN and that the call can remain active for more than 35 seconds.
- Verify that the user on the PSTN can end an active call by hanging up.
- Verify that an endpoint at the enterprise site can end an active call by hanging up.

9.2. Communication Manager Verification

The following commands can be entered in the Communication Manager SAT terminal to verify the SIP trunk functionality:

- **list trace station** <extension number>
Traces calls to and from a specific station.
- **list trace tac** <trunk access code number>
Trace calls over a specific trunk group.
- **status signaling-group** <signaling group number>
Displays signaling group service state.
- **status trunk** <trunk group number>
Displays trunk group service state.
- **status station** <extension number>
Displays signaling and media information for an active call on a specific station.

9.3. Session Manager Verification

Log in to System Manager. Under the **Elements** section, navigate to **Session Manager** → **System Status** → **SIP Entity Monitoring**. Click the Session Manager instance (*Session Manager* in the example below).

The screenshot displays the Avaya Aura System Manager 7.0 interface. The top navigation bar includes the Avaya logo, the text 'Aura System Manager 7.0', and a 'Last Logged on at March 23, 2017 10:10 AM' indicator with a 'Log off admin' button. The left sidebar contains a menu with categories: Session Manager, Network Configuration, Device and Location Configuration, Application Configuration, System Status (highlighted), Managed Bandwidth Usage, and Security Module Status. The 'System Status' category is expanded, showing 'SIP Entity Monitoring' as the selected option. The main content area is titled 'SIP Entity Link Monitoring Status Summary' and includes a 'Run Monitor' button. Below this is a table with the following data:

		Monitored Entities						
Session Manager	Type	Down	Partially Up	Up	Not Monitored	Deny	Total	
<input type="checkbox"/> Session Manager	Core	2	0	4	0	0	6	

Below the table, there is a 'Select: All, None' option and a link for 'All Monitored SIP Entities'.

Verify that the state of the Session Manager links to Communication Manager and the Avaya SBCE under the **Conn. Status** and **Link Status** columns is **UP**, like shown on the screen below.

The screenshot shows the Avaya Aura System Manager 7.0 interface. The left sidebar contains a navigation menu with 'System Status' and 'SIP Entity Monitoring' highlighted. The main content area displays 'Session Manager Entity Link Connection Status' with a table of 6 items. The table columns are: SIP Entity Name, SIP Entity Resolved IP, Port, Proto., Deny, Conn. Status, Reason Code, and Link Status. The 'Avaya SBCE' and 'Communication Manager Trunk 2' rows are highlighted with red boxes, showing 'UP' in both the 'Conn. Status' and 'Link Status' columns.

SIP Entity Name	SIP Entity Resolved IP	Port	Proto.	Deny	Conn. Status	Reason Code	Link Status
CS1K7.6	172.16.5.60	5085	UDP	FALSE	DOWN	408 Request Timeout	DOWN
Avaya SBCE	10.64.101.243	5061	TLS	FALSE	UP	200 OK	UP
AA-Messaging	10.64.101.250	5060	TCP	FALSE	UP	200 OK	UP
Communication Manager Trunk 1	10.64.101.241	5061	TLS	FALSE	UP	200 OK	UP
Communication Manager Trunk 98	10.64.101.241	5065	TLS	FALSE	UP	200 OK	UP
Communication Manager Trunk 2	10.64.101.241	5071	TLS	FALSE	UP	200 OK	UP

Other Session Manager useful verification and troubleshooting tools include:

- **traceSM** – Session Manager command line tool for traffic analysis. Login to the Session Manager command line management interface to run this command.
- **Call Routing Test** - The Call Routing Test verifies the routing for a particular source and destination. To run the routing test, from the System Manager Home screen navigate to **Elements** → **Session Manager** → **System Tools** → **Call Routing Test**. Enter the requested data to run the test.

9.4. Avaya SBCE Verification

There are several links and menus located on the taskbar at the top of the screen of the web interface that can provide useful diagnostic or troubleshooting information.

Alarms: This screen provides information about the health of the SBC.

The screenshot shows the Avaya Session Border Controller for Enterprise dashboard. At the top, there is a navigation bar with 'Alarms 1', 'Incidents', 'Status', 'Logs', 'Diagnostics', and 'Users'. The main header displays 'Session Border Controller for Enterprise' and the 'AVAYA' logo. A left sidebar lists various system management options. The main content area features a prominent red warning banner: 'This system contains one or more Avaya demo certificates. These certificates have been compromised and should not be used for any production traffic.' Below this, a blue box lists certificates expiring within the next 60 days, including 'Rapid_SSL_Cert.crt'. An 'Information' table provides system details such as System Time, Version, Build Date, License State (OK), and Failed Login Attempts. On the right, an 'Installed Devices' list shows 'Avaya_SBCE' with a red '1' icon. At the bottom, 'Alarms (past 24 hours)' and 'Incidents (past 24 hours)' sections are visible, both showing 'None found'.

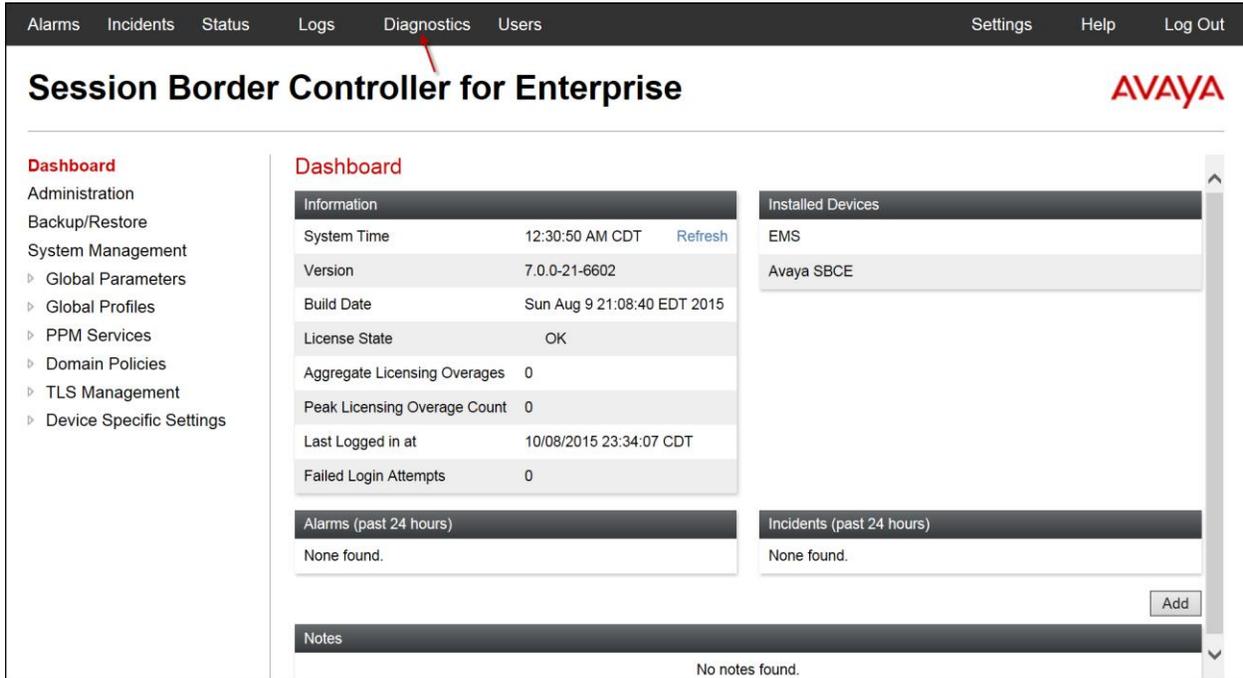

The following screen shows the **Alarm Viewer** page.

The screenshot displays the 'Alarm Viewer' page. The header includes 'Alarm Viewer' and the 'AVAYA' logo. On the left, a 'Devices' sidebar lists 'EMS' and 'Avaya_SBCE' with a red '1' icon. The main area has an 'Alarms' tab and a table with columns for 'ID', 'Details', 'State', 'Time', and 'Device'. A message states 'No alarms found for this device.' Below the table are 'Clear Selected' and 'Clear All' buttons.

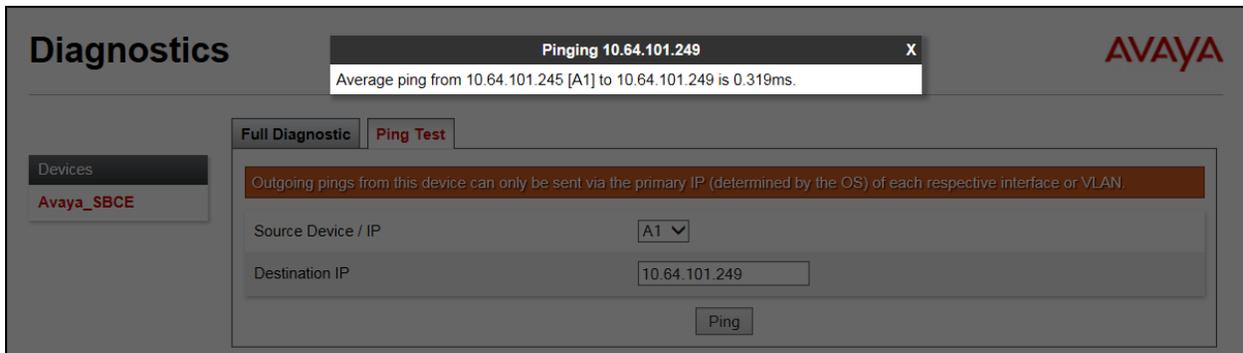

Incidents : Provides detailed reports of anomalies, errors, policies violations, etc.

The following screen shows the Incident Viewer page.

Diagnostics: This screen provides a variety of tools to test and troubleshoot the Avaya SBCE network connectivity.

The following screen shows the Diagnostics page with the results of a ping test.

Additionally, the Avaya SBCE contains an internal packet capture tool that allows the capture of packets on any of its interfaces, saving them as *pcap* files. Navigate to **Device Specific Settings** → **Troubleshooting** → **Trace**. Select the **Packet Capture** tab, set the desired configuration for the trace and click **Start Capture**.

The screenshot displays the Avaya SBCE web interface. At the top, there is a navigation bar with 'Alarms 1', 'Incidents', 'Status', 'Logs', 'Diagnostics', 'Users', 'Settings', 'Help', and 'Log Out'. The main header reads 'Session Border Controller for Enterprise' with the AVAYA logo on the right. A left-hand navigation menu includes 'Dashboard', 'Administration', 'Backup/Restore', 'System Management', 'Global Parameters', 'Global Profiles', 'PPM Services', 'Domain Policies', 'TLS Management', 'Device Specific Settings' (highlighted), 'Network Management', 'Media Interface', 'Signaling Interface', 'End Point Flows', 'Session Flows', 'DMZ Services', 'TURN/STUN Service', 'SNMP', 'Syslog Management', 'Advanced Options', 'Troubleshooting' (highlighted), 'Debugging', 'Trace' (highlighted), and 'DoS Learning'. The main content area is titled 'Trace: Avaya_SBCE' and contains two tabs: 'Packet Capture' (active) and 'Captures'. The 'Packet Capture Configuration' form includes the following fields: 'Status' (Ready), 'Interface' (B1), 'Local Address' (All), 'Remote Address' (*), 'Protocol' (All), 'Maximum Number of Packets to Capture' (10000), and 'Capture Filename' (Test.pcap). 'Start Capture' and 'Clear' buttons are located at the bottom of the form.

Once the capture is stopped, click the **Captures** tab and select the proper *pcap* file. Note that the date and time is appended to the filename specified previously. The file can now be saved to the local PC, where it can be opened with an application such as Wireshark.

The screenshot shows the Avaya Session Border Controller for Enterprise web interface. The top navigation bar includes 'Alarms 1', 'Incidents', 'Status', 'Logs', 'Diagnostics', 'Users', 'Settings', 'Help', and 'Log Out'. The main header displays 'Session Border Controller for Enterprise' and the 'AVAYA' logo.

The left sidebar contains a navigation menu with the following items: Dashboard, Administration, Backup/Restore, System Management (Global Parameters, Global Profiles, PPM Services, Domain Policies, TLS Management), Device Specific Settings (Network Management, Media Interface, Signaling Interface, End Point Flows, Session Flows, DMZ Services, TURN/STUN Service, SNMP, Syslog Management), Advanced Options (Troubleshooting), Debugging, Trace, and DoS Learning.

The main content area is titled 'Trace: Avaya_SBCE'. It features a 'Devices' dropdown menu with 'Avaya_SBCE' selected. Below this is a 'Packet Capture' section with a 'Captures' tab. The interface includes a table with the following data:

File Name	File Size (bytes)	Last Modified	
Test_20170324155515.pcap	0	March 24, 2017 3:55:30 PM EDT	Delete
DNS_20170322121545.pcap	12,288	March 22, 2017 12:19:35 PM EDT	Delete

10. Conclusion

These Application Notes describe the procedures required to configure Avaya Aura® Communication Manager 7.0, Avaya Aura® Session Manager 7.0 and Avaya Session Border Controller for Enterprise 7.1, to connect to the IntelPeer CoreCloud SIP Trunk service, as shown in **Figure 1**.

Interoperability testing of the sample configuration was completed with successful results for all test cases with the observations/limitations described in **Sections 2.1** and **2.2**.
